2015 Groundfish Operational Assessments Updates

Paul Nitschke

November 3, 2015

20 Groundfish Stocks

Rules for Engagement

- Update model runs and BRP estimates with limited changes to model configuration (m, selectivity, weighting, etc).
- Exclusion of ASAP likelihood constants.
- TOGA for NEFSC survey tow evaluation.
- Apply a retrospective adjustment to the t+1 abundance if the Mohn's Rho (7 year peel) estimate are outside of the model's 90% CI.

2011 Benchmark SARC 52

30+ Survey Area-Swept

September 17, 2015

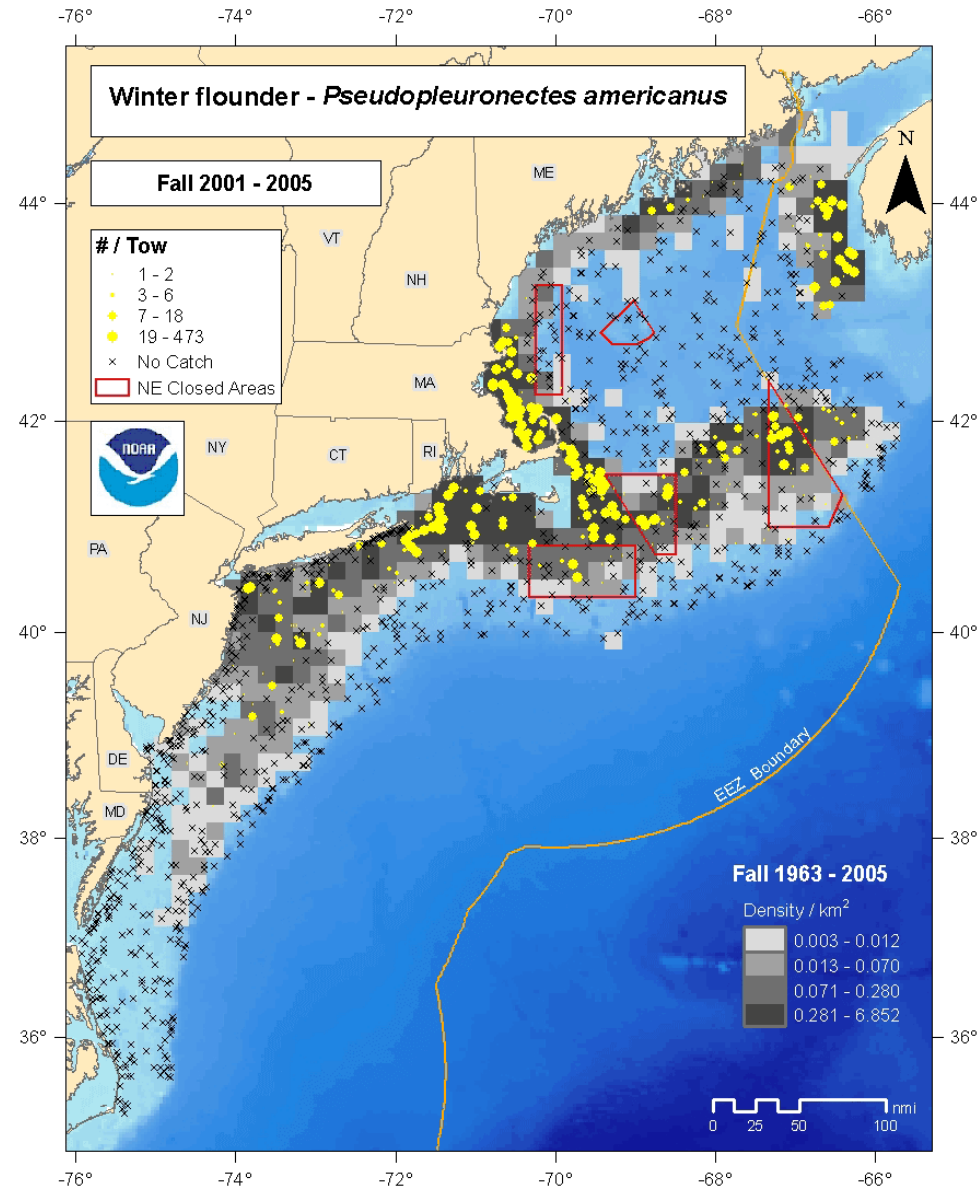

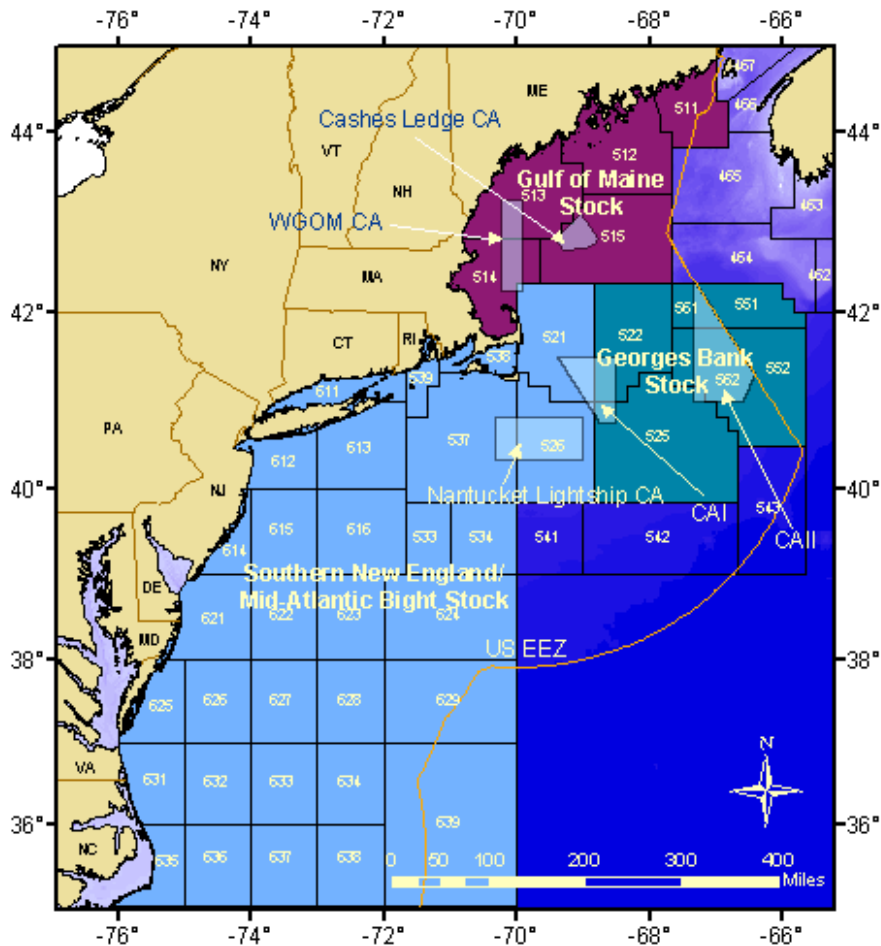

Assessment History

- Analytical model died at the SARC 52 Benchmark (2011) due to concerns with a large retrospective pattern. Models (VPA, SCALE, ASAP, SCAA) have difficulty with the apparent lack of a relationship between a large decrease in the catch with little change in the indices and age and/or size structure over time.
- Assessment is now based on 30+ cm area-swept biomass estimated directly from the surveys.

Current Status

- Overfished status is Unknown
- Overfishing not occurring

Assessment

- Update trends in the NEFSC, MDMF, and MENH surveys.
- Estimate 2015 catch (commercial & recreational landing, recreational discards, large mesh trawl discards and gillnet discards).

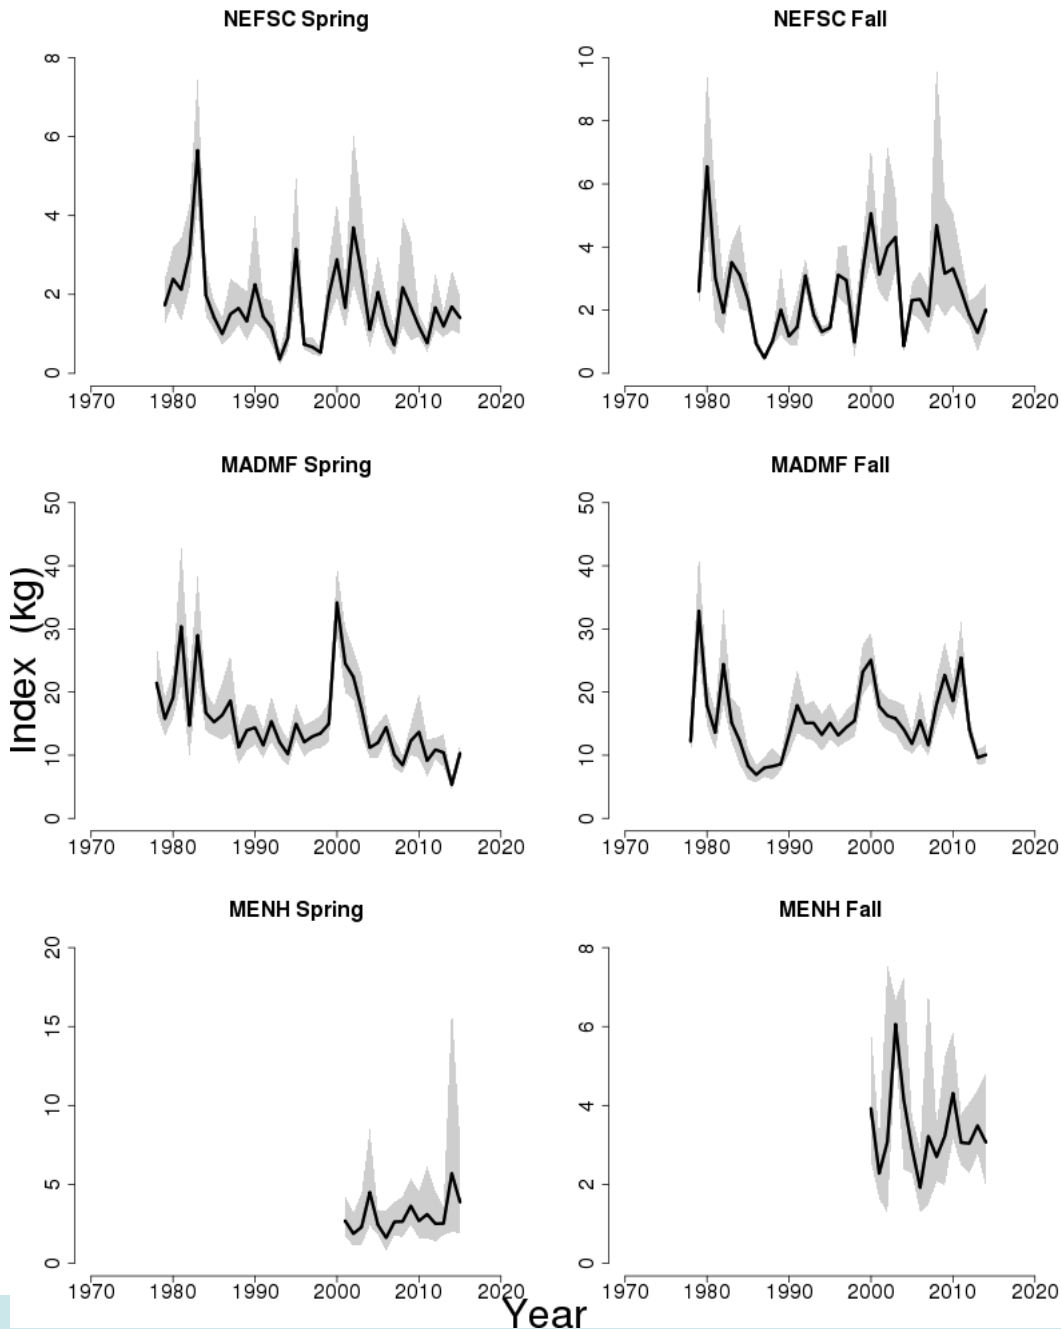

Year

Year

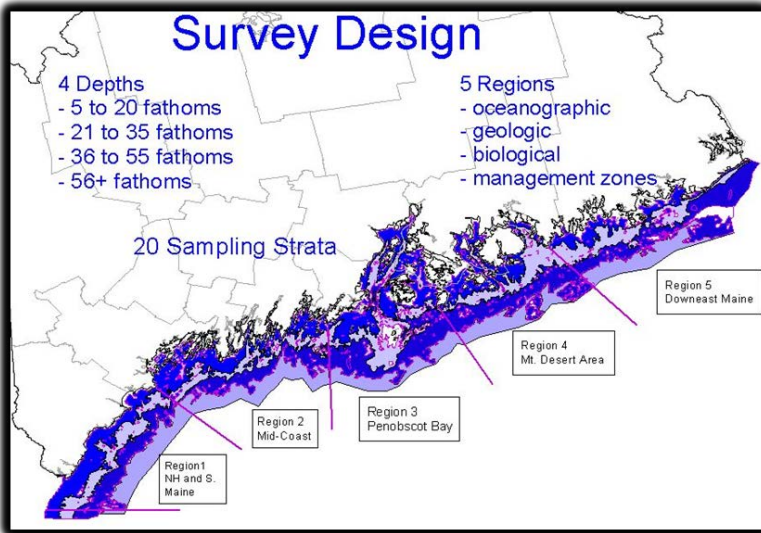

Commercial Discards assume a 50% mortality
Recreational Discards assume 15% mortality

Combined Surveys 30+ cm Biomass Estimate

- Estimate Fall 2014 and Spring 2015 30+ cm biomass from the NEFSC, MDMF and MENH surveys.

MENH Survey Length Distribution

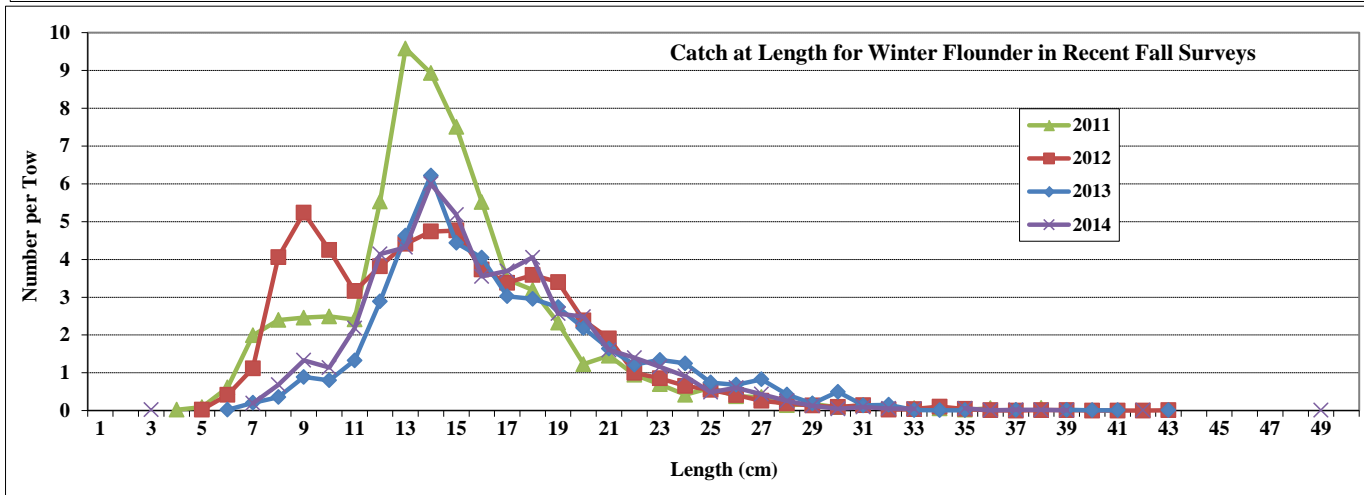

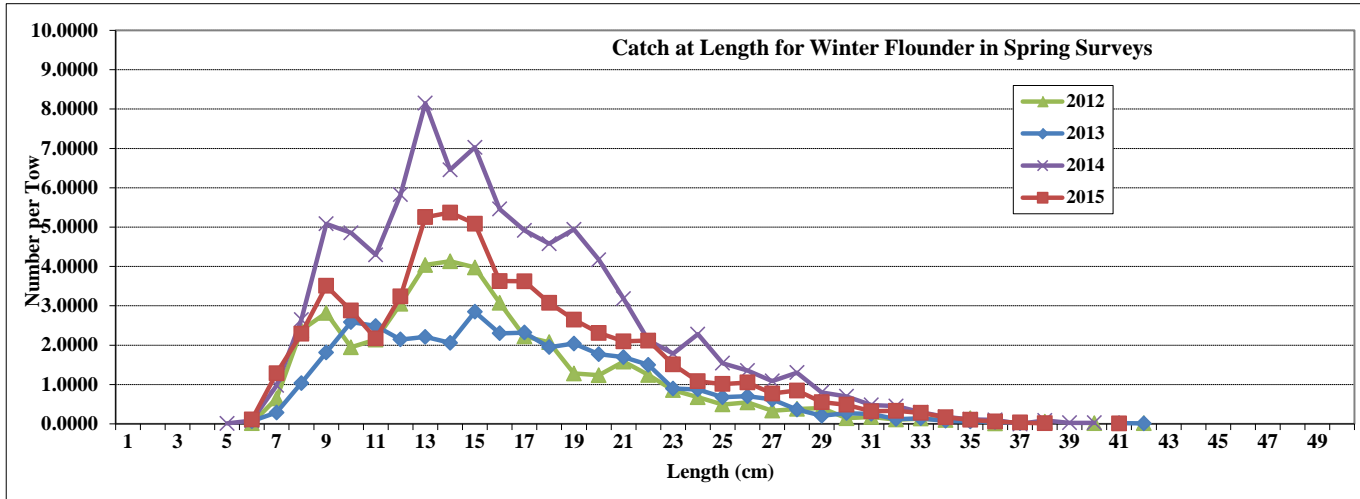

Table 7

Combined Survey Estimate

	NEFSC	MDMF	MENH
survey area (nm2)	2,990	309	3,475
Avg tow (wing area swept)	0.00700	0.00385	0.00462
Total area/tow footprint	427,143	80,343	752,154
Tow duration	20 min	20 min	20 min
Numbers per tow	34-65	80	35

Assessment

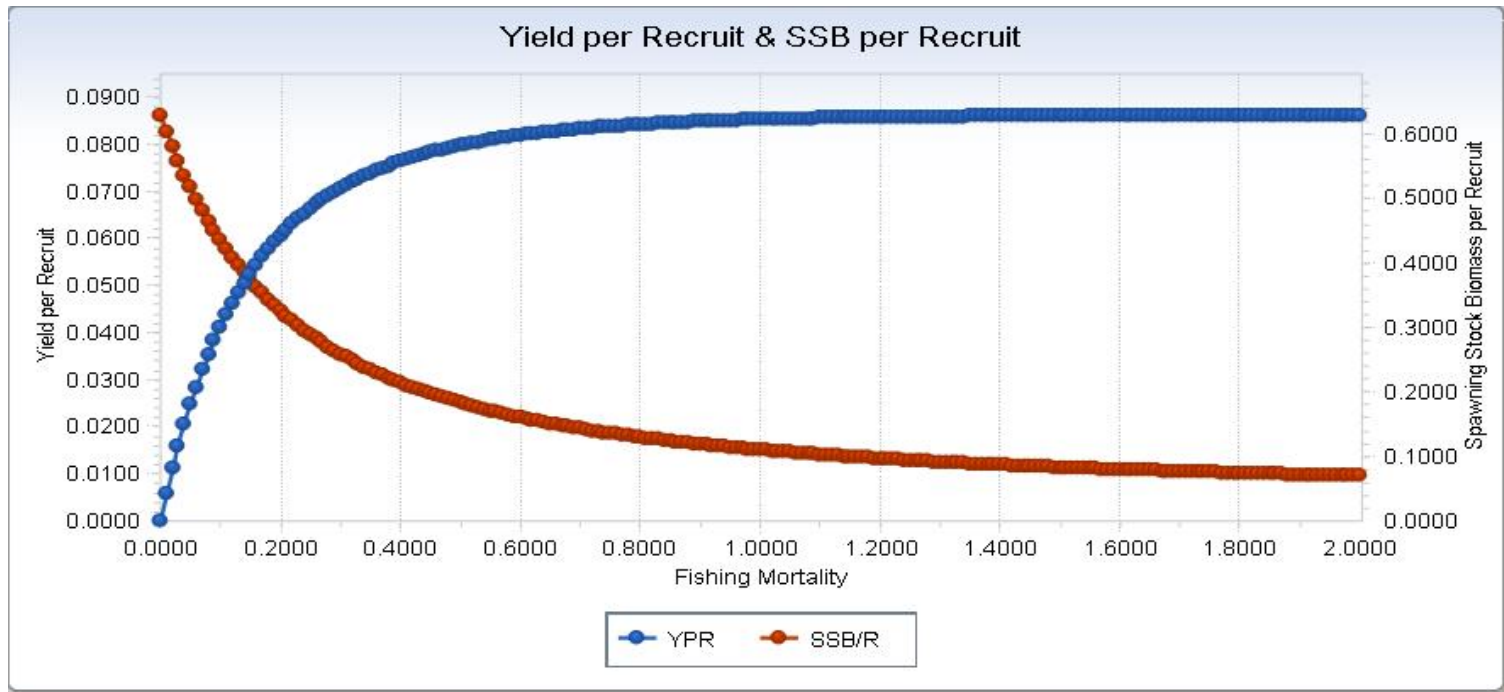

30+ cm Survey Area-Swept Biomass Estimate

Used in SARC 52 (2011) & 2014 Operational Update

- Exploitable Biomass = 30+ cm biomass index per tow x total survey area / tow footprint x q

$Q = 0.6$ Informed by GB winter flounder

- Exploitation rate = catch / 30+ cm biomass
- Overfishing BRPs based on F40% from Length based YPR (SARC 52, Not updated).

Length based YPR from SARC 52

$m=0.3$

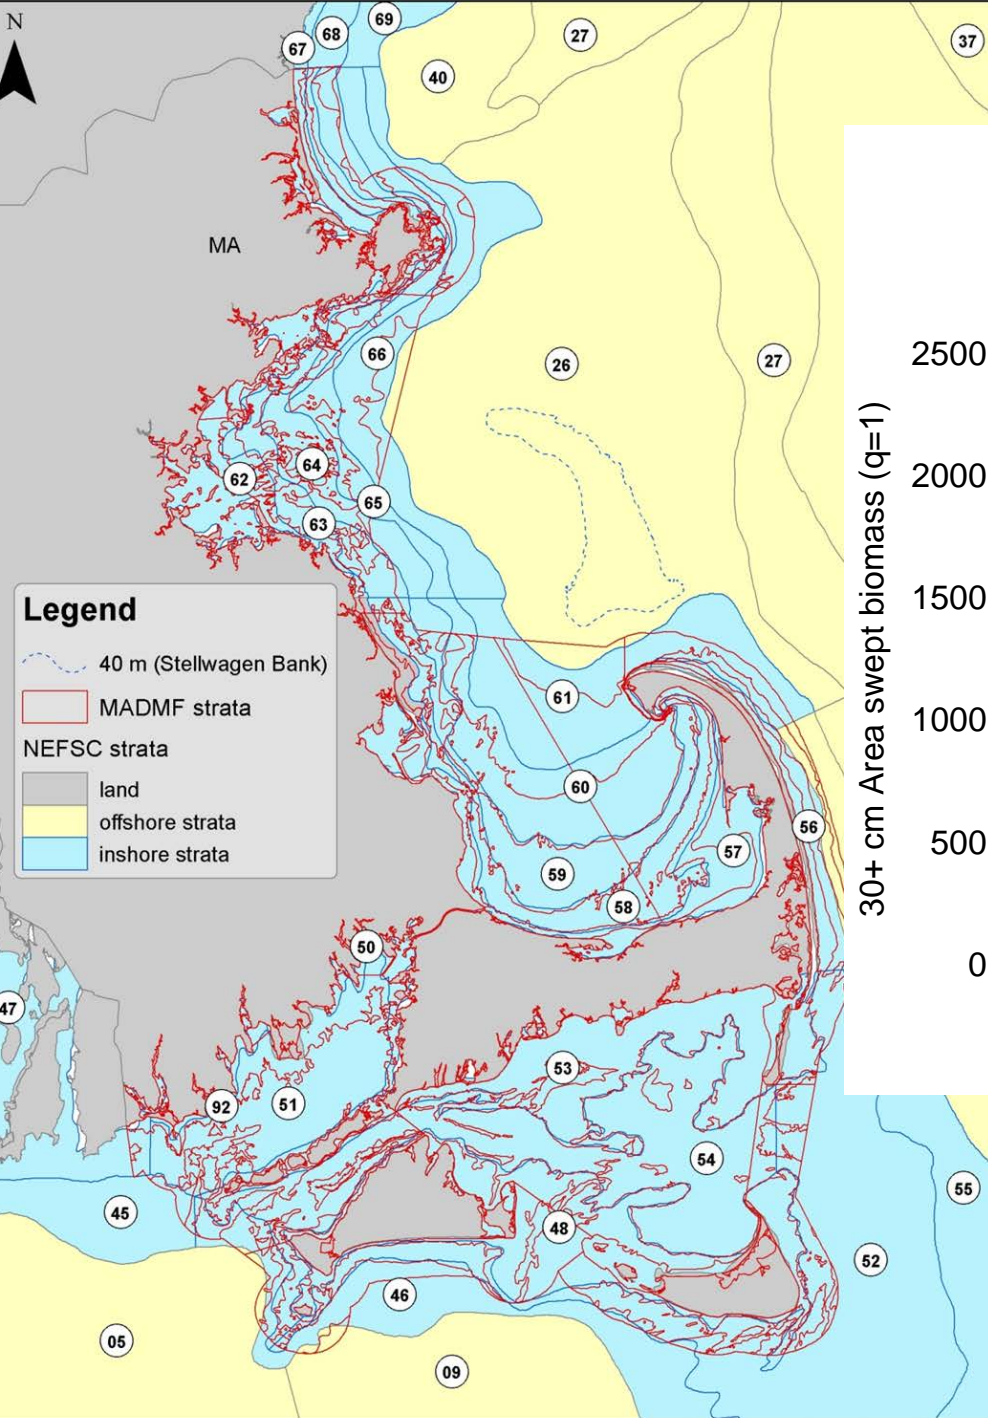

FMSY = F40% = 0.31

Exploitation rate = 0.23

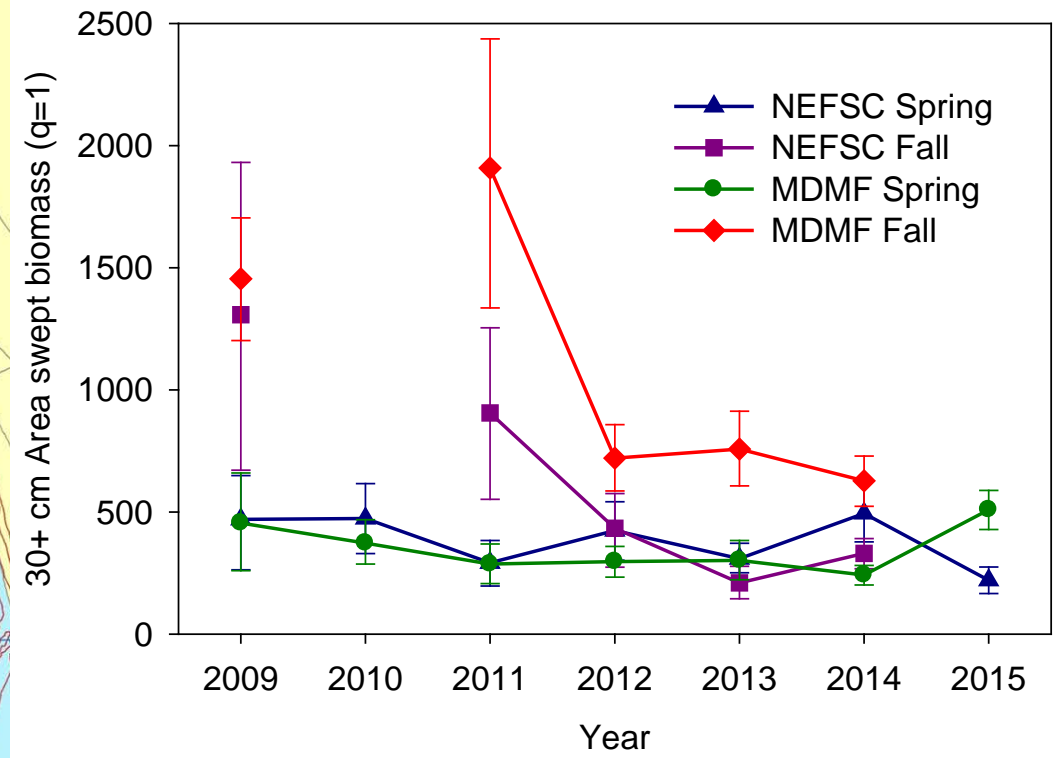

75%FMSY = 0.24

Exploitation rate = 0.17

Knife edge selectivity at 30 cm

Inshore overlap area 30+ Area Swept Biomass with 80% CI
 NEFSC biomass was adjusted to MDMF Area
 DMF total area = 72% NMFS total area

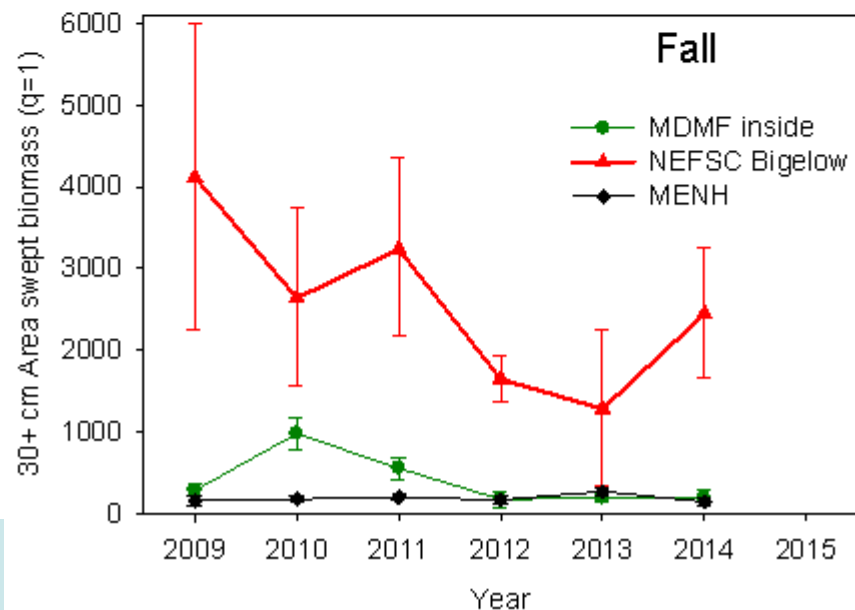

30+ Area Swept Biomass with 80% CI
Fall Components of the Combined Survey Estimate

30+ Area Swept Biomass with 80% CI
Fall Components of the Combined Survey Estimate

Uncertainty was estimated using the Latin Hypercube approach

$$B_{Tot} = A_{NEFSC} \frac{I_{NEFSC}}{e a_{NEFSC}} + A_{MADMF} \frac{I_{MADMF}}{e a_{MADMF}} + A_{MENH} \frac{I_{MENH}}{e a_{MENH}}$$

40 equal probability intervals

$$E[B_{Tot}] = \sum_{i=1}^{40} \sum_{j=1}^{40} \sum_{k=1}^{40} \sum_{l=1}^{40} \sum_{m=1}^{40} \sum_{n=1}^{40} \left[A_{NEFSC} \frac{I'_i}{e a'_j} + A_{MADMF} \frac{I'_k}{e a'_l} + A_{MENH} \frac{I'_m}{e a'_n} \right] \delta^6$$

40⁶ = 4,096,000,000 evaluations

Fall 2014

B Estimates vs Assumed Efficiency

	2014	Current
<i>E_{MSY} proxy</i>	0.23	0.23
<i>B_{MSY}</i>	Unkown	Unkown
MSY (mt)	Unkown	Unkown
<i>Overfishing</i>	No	No
<i>Overfished</i>	Unknown	Unknown

Sources of Uncertainty

Limited information exists to inform the Q assumption. There are questions with herding from the ground cables and escapement below the footrope and above the headrope in the surveys. The GB yellowtail 2014 empirical benchmark used a Q estimated from the flatfish literature (0.37 on the doors). However catch advice from door spread estimates would still have resulted in higher catch limits than the removals that have occurred.

Concerns

The lack of a response in the survey 30+ cm biomass is a general source of concern with catches remaining far below the overfishing limit.

Final Model Configuration

- Single Fleet
- 14 survey indices (9 Age 1-7, 5 Age 0)
- $M = 0.3$
- Maturity: Age 1: 0%, Age 2: 8%, Age 3: 56%, Age 4: 95%
Age 5+: 100%
- Two selectivity blocks: 1981-1993, 1994-2014, SAA
- No S-R fit in model

Results: Fleet Selectivities

Results: Index Selectivities

Southern New England/Mid-Atlantic Winter Flounder

Southern New England/Mid-Atlantic Winter Flounder

Results: Numbers at age

Results: Retrospective bias

- Retrospective bias has decreased in both F and SSB

Southern New England/Mid-Atlantic Winter Flounder

	2011	Current
F_{MSY}	0.290	0.325
SSB_{MSY} (mt)	43,661	26,928 (18,488 - 39,847)
MSY (mt)	11,728	7,831 (5,237 - 11,930)
Median recruits (age 1) (000s)	19,256	16,448
<i>Overfishing</i>	No	No
<i>Overfished</i>	Yes	Yes

Current Stock Status

- Status unchanged: Overfished, overfishing not occurring
- Minor retrospective bias, no adjustment made

Sources of Uncertainty

- Fixed natural mortality which is based on uncertain estimates of longevity (t_{max})
- Length distribution of the recreational discards. Very few samples in recent years however very small component of total catch
- Retrospective bias (F and SSB) is minor, however close to being outside of confidence bounds and needing adjustment

Southern New England/Mid-Atlantic Winter Flounder

<i>MODEL</i>	ASAP
<i>STOCK STATUS</i>	Overfished & Overfishing is not occurring
<i>REBUILDING</i>	2023 (Rebuilds at 40% probability with $F=0$)
<i>RETROSPECTIVE ADJUSTMENT</i>	No
<i>UNCERTAINTIES</i>	Recruitment continues to decline, natural mortality
<i>REVIEWER COMMENTS</i>	Change in productivity and poor fit to some survey data.
