Atlantic States Marine Fisheries Commission

Coastal Pelagics Management Board

November 8, 2022
10:45 a.m. – 12:15 p.m.
Hybrid Meeting

Draft Agenda

The times listed are approximate; the order in which these items will be taken is subject to change; other items may be added as necessary.

1. Welcome/Call to Order *(J. Cimino)* — 10:45 a.m.

2. Board Consent — 10:45 a.m.
   - Approval of Agenda
   - Approval of Proceedings from May 2022

3. Public Comment — 10:50 a.m.

4. Update on 2022 Spanish Mackerel Stock Assessment and Peer Review — 11:00 a.m.
   - Presentation of 2022 Stock Assessment Update to Date *(J. Carmichael)*
   - Presentation of 2022 Assessment Peer Review Report and Response from the South Atlantic Fishery Management Council *(J. Carmichael)*

5. Review Differences Between the Interstate Fishery Management Plan (FMP) and Federal FMP for Spanish Mackerel *(E. Franke)* — 11:40 a.m.

6. Consider Fishery Management Plan Reviews and State Compliance for the 2021 Fishing Year *(E. Franke)* **Action** — 11:55 a.m.
   - Spanish Mackerel
   - Atlantic Cobia

7. Other Business/Adjourn — 12:15 p.m.

The meeting will be held at The Ocean Place Resort (1 Ocean Boulevard Long Branch, NJ; 732.571.4000) and via webinar; click here for details

MEETING OVERVIEW

Coastal Pelagics Management Board
November 8, 2022
10:45 a.m. – 12:15 p.m.
Hybrid

Chair: Joe Cimino (NJ) Assumed Chairmanship: 11/21	Technical Committee Chair: Cobia: Angela Giuliano (MD)	Law Enforcement Committee Rep: Capt. Chris Hodge (GA)
Vice Chair: Erika Burgess (FL)	Advisory Panel Chair: Craig Freeman (VA)	Previous Board Meeting: May 2, 2022
Voting Members: RI, NY, NJ, DE, MD, PRFC, VA, NC, SC, GA, FL, SAFMC, NMFS (13 votes)		

2. Board Consent

- Approval of Agenda
- Approval of Proceedings from May 2022

3. Public Comment – At the beginning of the meeting, public comment will be taken on items not on the agenda. Individuals that wish to speak at this time must sign-in at the beginning of the meeting. For agenda items that have already gone out for public hearing and/or have had a public comment period that has closed, the Board Chair may determine that additional public comment will not provide additional information. In this circumstance, the Chair will not allow additional public comment on an issue. For agenda items that the public has not had a chance to provide input, the Board Chair may allow limited opportunity for comment. The Board Chair has the discretion to limit the number of speakers and/or the length of each comment.

4. Update on 2022 Spanish Mackerel Stock Assessment and Peer Review (11:00-11:40 a.m.)

Background

- The 2022 operational stock assessment for Atlantic Spanish mackerel (SEDAR 78) was completed in May 2022 **(Briefing Materials)**.
- The South Atlantic Fishery Management Council's (SAFMC) Scientific and Statistical Committee (SSC) reviewed SEDAR 78 in August 2022 and submitted their report for SAFMC consideration in September 2022 **(Briefing Materials)**.
- SEDAR 78 is currently undergoing additional review and analysis before being considered for management use.

Presentations

- Assessment overview to date by J. Carmichael
- Peer review summary and SAFMC response by J. Carmichael

5. Differences Between the Interstate and Federal FMPs for Spanish Mackerel (11:40-11:55 a.m.)

Background

- Differences between the Interstate and Federal FMPs for Spanish mackerel exist in terms of commercial management zones, commercial trip limits and closures, allowable gears, recreational season, and recreational accountability measures.
- The Board discussed these differences in February 2020, and postponed considering action to address these differences until completion of the 2022 stock assessment for Spanish mackerel.

Presentations

- Overview of management differences by E. Franke

6. Fishery Management Plan Reviews (11:55 a.m.-12:15 p.m.) Action

Background

- State Compliance Reports for Atlantic cobia were due on July 1, 2022.
- The Cobia Plan Review Team (PRT) reviewed each state report and compiled the annual FMP Review **(Briefing Materials)**.
- The Cobia PRT recommends the Board approve all *de minimis* requests from Rhode Island, New Jersey, Delaware, Maryland, Georgia, and Florida.
- State Compliance Reports for Spanish mackerel were due on October 1, 2022.
- The Spanish Mackerel PRT reviewed each state report and compiled the annual FMP Review **(Supplemental Materials)**.
- Rhode Island, New Jersey, and Delaware have requested and meet the requirements for *de minimis* for Spanish mackerel.

Presentations

- Overview of the FMP Review Reports by E. Franke

Board actions for consideration at this meeting

- Accept 2022 FMP Reviews and State Compliance Reports for Spanish mackerel and Atlantic cobia.
- Approve *de minimis* requests for Spanish mackerel and Atlantic cobia.

7. Other Business/Adjourn (12:15 p.m.)

Coastal Pelagics Board

Activity level: Moderate

Committee Overlap Score: Moderate

Committee Task List

- Cobia TC – Develop specification recommendations for the next quota block
- Cobia TC/PRT – July 1: Compliance Reports Due
- Spanish Mackerel PRT – October 1: Compliance Reports Due

Technical Committee Members:

Cobia TC: Angela Giuliano (MD, Chair), Nichole Ares (RI), Brian Neilan (NJ), Somers Smott (VA), Michael Loeffler (NC), Justin Yost (SC), Chris Kalinowsky (GA), Christina Wiegand (SAFMC), Michael Larkin (SERO), Emilie Franke (ASMFC)

Plan Review Team Members:

Cobia PRT: Angela Giuliano (MD), Somers Smott (VA), Chris McDonough (SC), Emilie Franke (ASMFC)

Spanish Mackerel PRT: McLean Seward (NC), BJ Hilton (GA), Chris Swanson (FL), Christina Wiegand (SAFMC), John Hadley (SAFMC), Emilie Franke (ASMFC)

DRAFT PROCEEDINGS OF THE

ATLANTIC STATES MARINE FISHERIES COMMISSION

COASTAL PELAGICS MANAGEMENT BOARD

The Westin Crystal City
Arlington, Virginia

May 2, 2022

These minutes are draft and subject to approval by the Coastal Pelagics Management Board.
The Board will review the minutes during its next meeting.

Draft Proceedings of the Coastal Pelagics Management Board
May 2022

The Coastal Pelagics Management Board of the Atlantic States Marine Fisheries Commission convened in the Jefferson Ballroom of the Westin Crystal City Hotel, Arlington, Virginia, a hybrid meeting, in-person and webinar; Monday, May 2, 2021 and was called to order at 1:00 p.m. by Chair Joe Cimino.

CALL TO ORDER

CHAIR JOE CIMINO: We are ready to get started here with our newest of ASMFC management boards, this is the first meeting of the Coastal Pelagics Management Board, I'm the new Chair. My name is Joe Cimino; I'm the Administrative Commissioner from New Jersey. I have with me from staff Emilie Franke and Angela Giuliano, who is the Chair of the TC from Maryland.

We have a couple items to go through. I think we should be able to get through our agenda quite easily. We'll have a presentation from Angela on the TC recommendations.

APPROVAL OF AGENDA

CHAIR CIMINO: To get started we'll go through the approval of the agenda. Are there any additions, or issues with the agenda as is? Not seeing any hands, we'll approve the agenda by consent.

APPROVAL OF PROCEEDINGS

CHAIR CIMINO: Approval of the proceedings from the October, 2020 meeting, again this is when it was a joint meeting of the South Atlantic. Any issues with the proceedings from the October, 2020 meeting? Okay, if not again, we'll consider that approved by consent.

PUBLIC COMMENT

CHAIR CIMINO: I'll take public comment on any items not on the agenda.

We have a possible action item following this. Once we get a motion for that action item, I'll allow public comment on that motion. This public comment period would just be on anything not on the agenda. Great, no hands, so we'll move on.

CONSIDER QUOTA BLOCK TIMEFRAME FOR COBIA

CHAIR CIMINO: Again, we'll be listening to the Technical Committee report for the consideration for possibly new Quota Block Timeframe for cobia. We're going to turn it right over to Angela.

TECHNICAL COMMITTEE REPORT

MS. ANGELA GIULIANO: Hi, as Joe said, my name is Angela Giuliano, and I work for the Maryland Department of Natural Resources. I'll be reviewing the Technical Committee report on the Quota Block recommendation. Just as an overview, because it's been a while since we've all met. I'll first go through a history of the current harvest specifications, including Amendment 1, then followed by Addendum I.

I'll review the two options that the Technical Committee discussed, as well as the data we considered when making our recommendation, and then going to the recommendation itself. As some background information on Amendment 1, Section 4.1 is where it describes the harvest specification process. The Board can set the total harvest quota, vessel limits, possession or bag limits, minimum size limits and the commercial closure trigger through the harvest specification process. The Board is able to set these for up to three years. A new specification should be implemented either after previous specifications have expired, or a new stock assessment is available. Then Amendment 1 also specifies that the harvest specification should occur no later than the fall meeting to be implemented the following year.

After the last stock assessment is when we set the current quota block for 2020 through 2022, and the Board at that time set the quota at 80,112 fish, which corresponded to about 2.4 million pounds per year. Following Amendment 1, this was allocated 92 percent to the recreational sector and 8 percent to the commercial sector.

You'll see the table here that shows the various quota options that at that time were considered by the Board, based off of projections provided by the Southeast Fishery Science Center following the last assessment. When the TC was doing these recommendations at that time, the focus was really on the probability of being overfished.

The projections went out through 2024, and as you can see that row highlighted in yellow is what was ultimately chosen by the Board as quota. That was the maximum recommended by the Technical Committee, and had a probability of being overfished of 0.25 by 2024, assuming 2.4 million pounds constantly caught each year.

Following setting of the quota, Addendum I was initiated, basically to reevaluate the allocation between the recreational and commercial sectors following a change in the MRIP estimates that incorporated the fishing effort survey. In 2021 the allocation changed to 96 percent recreational and 4 percent commercial.

However, the previously agreed upon quota of 80,112 fish remained the same. These changes in the quota became effective January 1st of 2021. Following these changes, a few of the states evaluated their landings relative to the new quota levels, and submitted new regulations to conform to their new soft recreational targets.

Specifically in Virginia, they reduced their harvest 42 percent, and North Carolina liberalized their regulations for private recreational anglers. In addition, some of the de minimis states changed their regulations as well in 2021, either moving to match Virginia's regulations, or implementing the new de minimis option that was provided in Addendum I.

There were two options considered by the Technical Committee for the Board meeting today. The first would be to maintain the 2020 through 2022 quota block. Basically, if this option were chosen, the Technical Committee would develop specification options for a new quota for the 2023 through 2025 fishing seasons during the summer of 20222.

These would be presented to the Board for their consideration at their fall 2022 meeting. Given all the management changes, however, that occurred in 2021, the other option would be to change the quota block to 2021 through 2023. If this option were chosen by the Board, the current total quota of 80,112 fish would remain the same for the 2023 fishing season. This would align with the new sector allocations and regulations implemented by some states in 2021. If this option were chosen, the Technical Committee would meet in the summer of 2023, to develop specification options for the 2024 through 2026 seasons. As the TC considered these two options, we first reviewed the previous projections that had been done following the last stock assessment, as well as we discussed the timing of the next stock assessment.

SEDAR 58 had a terminal year of 2017, and was accepted for management use in 2020. The next SEDAR assessment, which would be an update assessment is tentatively scheduled for 2025, which means the terminal year would likely be either 2023 or 2024, and it would likely be available to inform management in 2026.

We did reach out to the Southeast Fishery Science Center about extending any projections past 2024 being we would be setting quotas for a couple years without the projection available. They recommended against it, just because of the increasing uncertainty past the terminal year. However, the Technical Committee could request updated projections if there are particular concerns with the stock, either perceived changes in abundance, or if we want to incorporate more recent landings and discard information.

The second piece of information that the Technical Committee considered is where harvest has actually been, relative to the 2.4 million pounds used in the projections previously. As you can see from this table here. In 2019 and 2020, between the commercial and recreational sectors, we are

probably a little bit under 2.4 million pounds, 2021s landings are not complete at this point.

Final commercial landings won't be available until compliance reports are submitted in July. However, as you can see, even just looking at the MRIP estimate of pounds at this point, we are going to be over 2.4 million pounds. However, despite this variability the average over those three years is just under 2.4 million pounds, which is what those projections were assuming.

At this point the Technical Committee did not think it would be useful to update the projections at this point. With these considerations, the Technical Committee is recommending to change the quota block to 2021 to 2023. This aligns with the new sector allocation and the new regulations implemented by states in 2021.

When we go to evaluate states landings against their projected soft target, this would allow us to incorporate two years of consistent regulatory period. Moving the quota block is not expected to be a risk to the stock, given it was set fairly conservatively to begin with. As I mentioned before, the medium probability of being overfished was 0.25 in the terminal year of the projection, which was 2024.

As I just mentioned, while the individual year landings have been variable, the average harvest is about where we were in those projections conducted previously. As I mentioned previously, if the Board chooses to adopt this quota block, the Technical Committee plans to meet in 2023 to develop options for your consideration for the next quota block quota.

We would continue to monitor 2022 landings, to determine if there is a need to update the projections through 2024. If 2022s landings look similar to 2021, where they're much higher than 2.4 million pounds, we would probably go back to the Southeast Fishery Science Center and request some updated projections. As mentioned previously, these would be brought no later than the fall board meeting in 2023 for the Board's consideration to set for the 2024 fishing year. While we were having these discussions there were some general recommendations from the Technical Committee, just regarding future specification and assessments.

The first just being sure to monitor year to year changes and variability in state landings, as well as to continue to evaluate new data on overlap of the Atlantic and Gulf Coast stocks off of the Atlantic Coast of Florida, as new data becomes available. With that I will take any questions.

CHAIR CIMINO: Great, thank you, Angela. Any questions for Angela on the TCs recommendation? Yes, go ahead, Chris.

MR. CHRIS McDONOUGH: Just to clarify your update. If they had to update the projections, you're really only talking about updating one or two years beyond on the projections, one year?

MS. GIULIANO: Yes, so at the end of that last assessment we had the Southeast Fishery Science Center use, I think at that time 2018 landings had been finalized, and they use, I think a three-year average for 2019 estimate of landings. Then it was set at 2.4 million pounds for 2020 through 2024. We would be able to update what '19, '20, '21, '22, so yes it would be a few years updated.

CONSIDER CHANGES TO THE THREE-YEAR QUOTA BLOCK FOR COBIA HARVEST SPECIFICATIONS

CHAIR CIMINO: Okay, any other questions? Okay, fairly straightforward. We have a recommendation from the TC. I would hope we could see a motion on this to move this forward. Does anyone have a motion on this? Shanna, go ahead.

MS. SHANNA MADSEN: I would like to move that we take the TC recommendation of changing the cobia quota block to a timeframe of 2021 through 2023.

CHAIR CIMINO: Thanks, Shanna, get that up and then I'll ask for a second. Okay, there we are, Lynn,

is that a second? Okay, thank you. We have a motion and a second. Roy, we see you online, was your hand to second this?

MR. ROY W. MILLER: It was, Mr. Chairman.

CHAIR CIMINO: Okay, thank you.

MS. EMILIE FRANKE: To the maker of the motion, just as a friendly request from staff. If we could specify in the motion that accepting that quota block would set the quota for 2023 at the current quota level, with that suggested language on the screen, if that would be okay with the maker and the seconder.

MS. MADSEN: That's fine with me, I can read this into the record too as well. I didn't realize you guys had one crafted already. **Okay, so I would like to move to change the cobia quota block timeframe from 2020 to 2022, to 2021 to 2023 for the current annual total harvest quota of 80,112 fish, thereby setting the 2023 cobia harvest quota at 80,112 fish, resulting in a coastwide recreational quota of 76,908 fish, and a commercial quota of 73,116 pounds.**

CHAIR CIMINO: Thank you, Shanna, that's a motion by Shanna Madsen, second by Lynn Fegley. Any discussion on the motion? Okay, no hands, again, this is pretty straightforward, so I'm just going to ask, is there any objection to the motion? Not seeing any hands that's great. **We'll consider that motion passed by consent,** and we will move on to the other species for this new Board.

UPDATES ON SPANISH MACKEREL STOCK ASSESSMENT TIMELINE AND FEDERAL WATERS MANAGEMENT

CHAIR CIMINO: I'll turn it over to Emilie to talk Spanish mackerel for both the assessment and to give us some information on what is happening with management south of us.

MS. FRANKE: I just have two very brief updates on Spanish mackerel that were provided to us by South Atlantic Council staff and SEDAR staff. Again, the first is just on the stock assessment timeline for the next Spanish mackerel assessment, and the second is just an update on the management in federal waters, and a recent amendment from the South Atlantic Council.

As far as the stock assessment, the SEDAR 78 report for the Atlantic Spanish mackerel stock is actually now available online as of today, so that report was just released. The South Atlantic Fishery Management Council Scientific and Statistical Committee will review those SEDAR 78 results at their summer meeting, and discuss recommendations.

The South Atlantic Council will then review the assessment and the SSC recommendations at their September Council meeting. Just a brief update on that upcoming information on the Spanish mackerel stock. Then as far as federal waters management, Amendment 34 to the Federal Coastal Migratory Pelagic FMP was just approved by the South Atlantic Council and the Gulf of Mexico Council in March and April of this year, and Council staff are currently working to finalize that Amendment to be transmitted to NOAA.

That Amendment would allow cut off or damaged Spanish mackerel that are caught under the recreational bag limit and that complies with the minimum size limit, to be possessed and offloaded ashore. For this Amendment, damaged refers to Spanish mackerel that have been damaged due to predation. That is all, just quick updates. I might be able to answer a few questions. We also have SEDAR staff on the line, and if anyone else from the Council would like to add anything, go ahead.

CHAIR CIMINO: Yes, we have the Executive Director, so Mr. Carmichael, if you wouldn't mind giving us a little more information on that report.

EXECUTIVE DIRECTOR JOHN CARMICHAEL: Yes, thank you. It's great that the assessment came out to day, so time for the Board and what you guys summarized is absolutely correct. We're looking at

probably mid to late July right now for the SSC meeting. It will be a webinar meeting.

We can certainly let ASMFC know that is going on, because I imagine some folks from the Technical Committee and others might want to listen in to those discussions. The intent is that they will prove the ABC. That will go to the Council in September. It will go to the Advisory Panel in the fall, probably October.

Then back to the Council in December, and they'll start talking about the response. It will be a big topic of discussion during 2023. Hopefully a year, year and a half to get it in and get it approved. We're not anticipating statutory deadlines related to overfished or overfishing, at least based on the preliminary look at the assessment. That will certainly help us out with getting it done.

CHAIR CIMINO: Great, thanks, John. Question from Chris Batsavage.

MR. CHRIS BATSAVAGE: Thank you, Emilie for the update, and John for the detailed kind of timeline, as far as where this is going through the South Atlantic Council. Will this Board also receive a presentation on the stock assessment, either later this fall or early next year?

MS. FRANKE: We can work with Council staff and SEDAR staff to try to get something lined up for a future board meeting.

CHAIR CIMINO: I don't see any other questions. Did that wrap us up for Spanish? Okay.

ELECT VICE-CHAIR

CHAIR CIMINO: We have one other item on the agenda that we'll need action on, and that is electing a Vice-Chair. Doug.

MR. DOUG HAYMANS: I would like to nominate Erika Burgess from the great state of Florida Chair, as the Vice-Chair, excuse me.

CHAIR CIMINO: **We have a nomination for Erika Burgess of Florida. I see some hands, I'm assuming those are hands in support, very good, thank you.** This is how we do things. Erika is not able to be here, so she is fairly in. Sorry, she knew ahead of time, don't worry about it.

ADJOURNMENT

CHAIR CIMINO: Any other business to come before the Board today? Okay, no hands, very good. I appreciate everyone's time today. Thank you to staff and Angela for all the help in getting us through this.

(Whereupon the meeting convened at 1:21 p.m. on Monday May 2, 2022.)

SEDAR 78

South Atlantic Spanish Mackerel

Section I: Introduction

May 2022

SEDAR
4055 Faber Place Drive, Suite 201 North Charleston, SC 29405

I. Introduction

1. SEDAR Process Description

SouthEast Data, Assessment, and Review (SEDAR) is a cooperative Fishery Management Council process initiated in 2002 to improve the quality and reliability of fishery stock assessments in the South Atlantic, Gulf of Mexico, and US Caribbean. The improved stock assessments from the SEDAR process provide higher quality information to address fishery management issues. SEDAR emphasizes constituent and stakeholder participation in assessment development, transparency in the assessment process, and a rigorous and independent scientific review of completed stock assessments.

SEDAR is managed by the Caribbean, Gulf of Mexico, and South Atlantic Regional Fishery Management Councils in coordination with NOAA Fisheries and the Atlantic and Gulf States Marine Fisheries Commissions. Oversight is provided by a Steering Committee composed of NOAA Fisheries representatives: Southeast Fisheries Science Center Director and the Southeast Regional Administrator; Regional Council representatives: Executive Directors and Chairs of the South Atlantic, Gulf of Mexico, and Caribbean Fishery Management Councils; a representative from the Highly Migratory Species Division of NOAA Fisheries; and Interstate Commission representatives: Executive Directors of the Atlantic States and Gulf States Marine Fisheries Commissions.

SEDAR 78 addressed the stock assessment for South Atlantic Spanish Mackerel. The assessment process consisted of a series of webinars held from May 2021 – March 2022. The Stock Assessment Report is organized into 2 sections. Section I –Introduction contains a brief description of the SEDAR Process, Assessment and Management Histories for the species of interest, and the management specifications requested by the Cooperator. Section II is the Assessment Process report. This section details the assessment model, as well as documents any data recommendations that arise for new data sets presented during this assessment process, or changes to data sets used previously.

The final Stock Assessment Reports (SAR) for South Atlantic Spanish Mackerel was disseminated to the public in May 2022. The Council's Scientific and Statistical Committee (SSC) will review the SAR for its stock. The SSCs are tasked with recommending whether the assessments represent Best Available Science, whether the results presented in the SARs are useful for providing management advice and developing fishing level recommendations for the Council. An SSC may request additional analyses be conducted or may use the information provided in the SAR as the basis for their Fishing Level Recommendations (e.g., Overfishing Limit and Acceptable Biological Catch). The South Atlantic Fishery Management Council's SSC will review the assessment at its Summer 2022 meeting, followed by the Council receiving the SAR at the Fall 2022 meeting. Documentation on SSC recommendations is not part of the SEDAR process and is handled through each Council

2. Atlantic Spanish Mackerel Management Overview

2.1 Fishery Management Plan and Amendments

The following summary describes only those management actions that likely affect Atlantic Spanish mackerel fisheries and harvest.

FMP Amendments affecting Atlantic Spanish mackerel:

Description of Action	Amendment	Effective Date
• Set MSY = OY = TAC (27,000,000 pounds). • Minimum size limit for is 12 inches FL, except for incidental catch allowance of 5% of the total catch by weight aboard.	Original FMP (SAFMC 1982) 48 FR 5274	February 4, 1983
• Provided framework procedure for pre-season adjustment of TAC. • TAC = 27,000,000 pounds • Limited purse seine harvest to 300,000 lbs in Atlantic and 300,000 lbs in Gulf • Minimum size limit for the commercial and recreational sectors are 12 inches FL or 14 inches TL.	Amendment 1 (SAFMC 1985) 50 FR 34846	August 28, 1985
• Revised MSY and clarified TAC must be set below the upper range of the ABC. • Recognized two migratory groups, Gulf and South Atlantic, with Dade/Monroe county line as the migratory group boundary. • TAC = 2,900,000 pounds • Established allocations for TAC, commercial (2,200,000 pounds, 76%) and recreational (700,000 pounds, 24%). • Established April 1 to March 31 fishing year. • Recreational bag limit of 4 fish in FL and 10 in NC, SC, and GA. • Charter boat permits were required.	Amendment 2 (SAFMC 1987) 52 FR 23836	June 25,1987

Description of Action	Amendment	Effective Date
• Prohibited drift gill nets for coastal pelagics and purse seines for the overfished group of mackerels.	Amendment 3 (SAFMC 1989) 54 FR 29561	July 13, 1989
• Reallocated Atlantic group Spanish mackerel equally between recreational and commercial fishermen. • TAC = 6,000,000	Amendment 4 (SAFMC 1989) 54 FR 38526	September 19, 1989
• Extended the management area for the Atlantic groups of mackerels through the Mid Atlantic Fishery Management Council's area of jurisdiction. • Revised the definition of overfishing. • Redefined recreational bag limits as daily limits, and removed the provision specifying that bag limit caught mackerel may be sold. • Size limit for Spanish mackerel is 12 " FL or 14" TL. • Bag limit is 4 fish off FL and 10 fish north of FL.	Amendment 5 (SAFMC 1990) 55 FR 29370	July 19, 1990

Description of Action	Amendment	Effective Date
• Specified rebuilding periods for overfished mackerel stocks. • Provided for commercial Atlantic Spanish mackerel possession limits. • In the northern zone, boats are restricted to possession limits of 3,500 pounds. In the southern zone trip limit are 1,500 pounds per vessel per day from April 1 to November 30. From December 1 until 80% of quota is taken: unlimited harvest on Monday, Wednesday, and Friday; 1,500 pounds per vessel per day on Tuesday and Thursday; 500 pounds per vessel per day on Saturday and Sunday. Trip limit 1,000 pounds per vessel per day when 80% of quota is reached. The adjusted quota for Spanish mackerel is 3,250,000 pounds. • Discontinued the reversion of the bag limit to 0 when the recreational quota is filled. • Modified the recreational fishing year to the calendar year, • Changed commercial permit requirements to allow qualification in one of three preceding years. • Changed all size limits to fork length only. Minimum size limit is 12 inches FL.	Amendment 6 (SAFMC 1992) 57 FR 58151	December 9, 1992
• Modified requirements for a king or Spanish mackerel permit. • Set the OY target to 40% static SPR for the Atlantic. • Modified the seasonal framework adjustment measures.	Amendment 8 (SAFMC 1994) 63 FR 10561	March 4, 1998
• Allowed the retention and sale of damaged, legal sized king and Spanish mackerel within established trip limits.	Amendment 9 (SAFMC 1998) 64 FR 16336	March 28, 2000

Description of Action	Amendment	Effective Date
• Established EFH in the South Atlantic	Amendment 10 (SAFMC 1998) 65 FR 37292	July 14, 2000
• Addressed Sustainable Fishery Act definitions.	Amendment 11 (SAFMC 1999)	December 1999
• Changed the fishing year for Atlantic group Spanish mackerel to March 1 through February 28/29.	Amendment 15 SAFMC (2004) 70 FR 39187	July 7, 2005
• Stock ACL= 5,690,000 pounds. • Commercial = 3,130,000 pounds and recreational = 2,560,000 pounds • Accountability Measures (AMs): Commercial sector to close when commercial ACL will be met; payback when total ACL is exceeded (and overfished). Recreational sector to lower bag limit, if necessary, if total ACL is also exceeded.	Amendment 18 SAFMC 2011 76 FR 82058	January 20, 2012
• Established coral HAPCs.	Amendment 19 in CE-BA1 SAFMC 2009 75 FR 35330	July 22, 2010

Description of Action	Amendment	Effective Date
• Prohibits king mackerel and Spanish mackerel bag limit sales in Atlantic except state permitted tournaments. • Removes income requirements for CMP permits.	Amendment 20A SAFMC 2013 79 FR 34246	July 16, 2014
• Recreational fishing measures in SC SMZs.	Amendment 21 in CE-BA 2 SAFMC 2011 76 FR 82183	January 30, 2012
• Requires weekly electronic reporting for headboats in South Atlantic.	Amendment 22 in HB reporting amendment SAFMC 2013 78 FR 78779	January 27, 2014
• King mackerel and Spanish mackerel dealers must get the universal permit. • Federal king mackerel and Spanish mackerel permit holders must sell to federal dealer. • Requires weekly electronic reporting for federal dealers.	Amendment 23 in Generic Dealer Amendment	August 7, 2014

Description of Action	Amendment	Effective Date
	SAFMC 2013 79 FR 19490	
• Set Northern (NC/SC line north) and Southern (NC/SC line south) zones and associated commercial quotas. • Northern Zone- 622,870 pounds; Southern Zone - 2,507,130 pounds.	Amendment 20B SAFMC 2014 80 FR 4216	March 1, 2015
• For hire reporting requirements.	Amendment 27 SAFMC 2017	January 4, 2021

SAFMC Regulatory Amendments affecting Atlantic Spanish mackerel:

Description of Action	Amendment	Effective Date
• Commercial allocation is 2,360,000 pounds and recreational allocation is 740,000 pounds. • Bag limits is 4 fish off FL and 10 fish north of FL.	52 FR 25012	July 2, 1987
• Final Rule on technical amendment that allows catch of Spanish mackerel under minimum size limit equal to 5% by weight of total catch or Spanish mackerel on board.	52 FR 36578	September 30, 1987
• Changed TAC to 4,000,000 pounds with 960,000 pounds allocated to the recreational sector and 3,040,000 pounds allocated to the commercial sector.	53 FR 25611	July 8, 1988
• TAC increased to 6,000,000 pounds with 1,440,000 pounds allocated to the recreational sector and 4,600,00 pounds allocated to the commercial sector.	54 FR 24920	April 1, 1989
• TAC changed to 5,000,000 pounds with 3,140,000 pounds allocated to the commercial sector and 1,860,000 pounds allocated to the recreational sector.	55 FR 25986	June 26, 1990
• TAC increased to 7,000,000 pounds with 3,500,000 pounds allocated to commercial sector and 3,500,000 pounds allocated to recreational sector. • Bag limit is 10 fish for areas north of FL and 5 fish for FL.	56 FR 29920	July 1, 1991
• Increased bag limit in Florida to that adopted by the state of FL but not to exceed 10 fish.	57 FR 33924	July 31, 1992

Description of Action	Amendment	Effective Date
• TAC increased to 9,000,000 with 4,500,000 pounds commercial and 4,500,000 pounds recreational. • The initial change in the trip limit occurs when 75% of the quota is met instead of 80%.	58 FR 40613	July 29, 1993
• TAC for Atlantic Spanish mackerel is increased to 9,200,000 pounds (4,600,000 pounds commercial and 4,600,000 pounds recreational).	59 FR 40509	April 1, 1994
• TAC increased to 9,400,000 pounds (4,700,000 pounds commercial and 4,700,000 pounds recreational).	60 FR 39698	April 1, 1995
• Reduced to 7,000,000 (3,500,000 pounds commercial and 3,500,000 pounds recreational). • Modify trip regime for commercial vessels off Florida east coast: Nov 1 rather than Dec 1 start for unlimited harvest season and increase the Saturday-Sunday daily trip limit from 500 to 1,500 pounds during that season and increase the daily trip limit from 1,000 to 1,500 pounds for all days of the week during the period that follows the unlimited season and continues until the adjusted quota is taken.	62 FR 23671	May 1, 1997
• Increased the TAC l to 8,000,000 pounds (4,000,000 pounds commercial and 4,000,000 pounds recreational).	62 FR 53278	April 1, 1997
• Decrease the TAC to 6,600,000 pounds and change the allocation from 50/50 to 55% commercial (3,630,000 pounds) and 45% recreational (2,970,000 pounds).	64 FR 45457	August 20, 1999

Description of Action	Amendment	Effective Date
• Increase TAC to 7,040,000 pounds with 3,870,000 pounds commercial and 3,170,000 pounds recreational. • The trip limit from April 1 to November 30 would be 3,500 lb; from December 1 until 75% of the adjusted quota is taken there would be no trip limit on Monday through Friday and on Saturday and Sunday the trip limit would be 1,500 lbs. • The recreational bag limit is increased from 10 to 1S5 fish per person per day. • MSY = 5.7-7.5 million pounds, Bmsy = 12.2-15.8, MSST = 8.5-11.1, MFMT = 0.38-0.48.	65 FR 41015	July 3, 2000
• Reduce Atlantic Spanish mackerel trip limit to 1,500 lbs per day from March 1, 2004 to March 31, 2004.	69 FR 9969	March 3, 2004
• Reduce trip limit for Atlantic Spanish mackerel to 1,500 lbs from February 1, 2005 to March 31, 2005.	70 FR 5569	February 3, 2005
• Reduce Atlantic Spanish mackerel trip limit to 1,500 lbs from February 5, 2007 to February 28, 2007.	72 FR 5345	February 6, 2007
• Change start date for commercial trip limit of the Atlantic Spanish mackerel in southern zone (off FL) to March 1.	73FR439	January 3, 2008
• Provisions for transfer at sea for gillnets when one set exceeds Spanish mackerel trip limit	Framework Action SAFMC 2013 79 FR 68802	December 19, 2014

Description of Action	Amendment	Effective Date
• ACL= 6,063,000 pounds with commercial 3,330,000 pounds and recreational 2,727,000 pounds.	FW Amendment 1 SAFMC 2014 79 FR 69058	December 22, 2014
• Trip limits in Southern Zone (SC, GA, FL): 3,500lbs until 75% adjusted quota is met, then 1,500lbs until adjusted quota is met and then 500lbs until the full quota is met.	FW Amendment 2 SAFMC 2014 80 FR 40936	August 13, 2015
• Permit restrictions: removes the restriction on fishing for, or retaining, the recreational bag and possession limits of king and Spanish mackerel on a vessel with a Federal commercial permit for king or Spanish mackerel when commercial harvest of king or Spanish mackerel in a zone or region is closed.	FW Amendment 5 SAFMC 2016 82 FR 35658	August 31, 2017

2.2 Emergency and Interim Rules (if any)

Description of Action	FRN	Effective Date
• Divided 3.716 million pounds quota into three areas with 1.869 million pounds going to the Atlantic. o The Atlantic boundary was bounded by the North Carolina/Virginia state line and a line directly east of the Dade/Monroe County, Florida boundary. • Established a recreational bag limit of 4-fish per trip and allowed sale of recreationally caught Spanish mackerel under the bag limit. • January 1, 1987 to March 31, 1987	52 FR 290	January 5, 1987
• 90-day extension of January 1, 1987 to March 31, 1987 emergency rule for Spanish mackerel.	52 FR 10762	April 3, 1987

2.3 Secretarial Amendments (if any)

None for Atlantic Spanish mackerel.

2.4 Control Date Notices (if any)

March 7, 2019: participants who enter the commercial sector after March 7, 2019, will not be assured of future access if a management regime that limits participation in the sector is prepared and implemented.

2.5 Management Program Specifications

Table 2.5.1. General Management Information

Species	Spanish mackerel (*Scomberomorus maculatus*)
Management Unit	Atlantic migratory group Spanish mackerel
Management Unit Definition	All waters from the intersection of New York, Connecticut, and Rhode Island to a line extending due east of the Miami-Dade/Monroe County line
Management Entity	South Atlantic Fishery Management Council (Note: Mid-Atlantic Council participates as voting member on South Atlantic Council's Mackerel Cobia Committee.)
Management Contacts SERO / Council	SAFMC: Christina Wiegand SERO: Mary Vara/Karla Gore
Current stock exploitation status	Not undergoing overfishing
Current stock biomass status	Not overfished

Table 2.5.2. Management Parameters

Criteria	South Atlantic – Current (SEDAR 28)		
	Definition	**Values**	**Units**
M	Average of Lorenzen M (if used)	0.35	Instantaneous natural mortality; per year
$F_{CURRENT}$	Geometric mean of full fishing mortality rates for 2009-2011 ($_{F2009-2011}$)	0.36	Per year
F_{TARGET}			
Yield at F_{TARGET} (equilibrium)			
F_{MSY}	F_{MSY}	0.69	Per year
B_{MSY}	Biomass at MSY	9548	Metric tons
R_{2012}			
R_{MSY}			
$R_{UNFISHED}$			
SSB_{2011}	Spawning stock biomass in 2011	4862	Metric tons
SSB_{MSY}	Spawning stock biomass at MSY	3266	Metric tons
MSST[1]	MSST = [(1-M) or 0.7 whichever is greater]*B_{MSY}	2127	Metric tons
MFMT	F_{MSY}	0.69	Per year
MSY	Yield at F_{MSY}	2750	Metric tons
OY	Yield at F_{OY}		
F_{OY}	F_{OY} = 65%, 75%, 85% F_{MSY}	65% F_{OY} = 0.449 75% F_{OY} = 0.518 85% F_{OY} = 0.587	
Exploitation Status	$F_{2009-2011}$/ F_{MSY}	0.526	
	F_{2011}/ F_{MSY}	0.521	
Biomass Status	SSB_{2011}/MSST	2.29	
	SSB_{2011}/ SSB_{MSY}	1.49	
Terminal F (2011)			
Terminal Biomass (2011) [1]			
Generation Time			
$T_{REBUILD}$ (if appropriate)			

Table 2.5.2. Management Parameters Continued				
Criteria	**South Atlantic – Proposed (SEDAR 78)**			
	Definition	**Base Run Values**	**Units**	**Median of Base Run MCBs**
M	Average of Lorenzen M (if used)			
$F_{CURRENT}$	Geometric mean of full fishing mortality rates for 2009-2011 ($F_{2009-2011}$)			
F_{TARGET}				
Yield at F_{TARGET} (equilibrium)				
F_{MSY}	F_{MSY}			
B_{MSY}[1]	Biomass at MSY			
R_{MSY}				
SSB				
SSB_{MSY}	Spawning stock biomass at MSY			
MSST[1]	MSST = [(1-M) or 0.7 whichever is greater]*B_{MSY}			
MFMT	F_{MSY}			
MSY	Yield at F_{MSY}			
OY	Yield at F_{OY}			
F_{OY}	F_{OY} = 65%, 75%, 85% F_{MSY}			
Exploitation Status				
Biomass Status[1]				
Terminal F	-			
Terminal Biomass [1]	-			
Generation Time	-			
$T_{REBUILD}$ (if appropriate)	-			

[1]Biomass values reported for management parameters and status determinations should be based on the biomass metric recommended through the Assessment process and SSC. This may be total, spawning stock or some measure thereof, and should be applied consistently in this table.

NOTE: "Proposed" columns are for indicating any definitions that may exist in FMPs or amendments that are currently under development and should therefore be evaluated in the current assessment. Please clarify whether landings parameters are 'landings' or 'catch' (Landings + Discard). If 'landings', please indicate how discards are addressed.

Table 2.5.3. Stock Rebuilding Information

None – Atlantic migratory group Spanish mackerel is not currently overfished.

Table 2.5.4. General Projection Specifications

South Atlantic

First Year of Management	2024/2025
Interim basis	ACL, if ACL is met. Average exploitation, if ACL is not met.
Projection Outputs	
Landings	Pounds and numbers
Discards	Pounds and numbers
Exploitation	F & Probability F>MFMT
Biomass (total or SSB, as appropriate)	SSB & Probability SSB>MSST (and Prob. SSB>SSB_{MSY} if under rebuilding plan)
Recruits	Number

Table 2.5.5. Base Run Projections Specifications. Long Term and Equilibrium conditions.

Criteria	Definition	If overfished	If overfishing	Neither overfished nor overfishing
Projection Span	Years	$T_{REBUILD}$	10	10
Projection Values	$F_{CURRENT}$	X	X	X
	F_{MSY}	X	X	X
	75% F_{MSY}	X	X	X
	$F_{REBUILD}$	X		
	F=0	X		

NOTE: Exploitation rates for projections may be based upon point estimates from the base run (current process) or upon the median of such values from the MCBs evaluation of uncertainty. The critical point is that the projections be based on the same criteria as the management specifications.

Table 2.5.6. P-star projections. Short term specifications for OFL and ABC recommendations. Additional P-star projections may be requested by the SSC once the ABC control rule is applied.

Basis	Value	Years to Project	P* applies to
P*	50%	Interim + 5	Probability of overfishing
P*	TBD[1]	Interim + 5	Probability of overfishing
Exploitation	F_{MSY}	Interim + 5	NA
Exploitation	75% of F_{MSY}	Interim + 5	NA

[1] To be determined by the SSC.

Table 2.5.7. Quota Calculation Details

If the stock is managed by quota, please provide the following information.

	Atlantic Spanish Mackerel
Current Acceptable Biological Catch (ABC) and Total Annual Catch Level (ACL) Value for Spanish Mackerel	ACL = ABC = OY ACL = 6,063,000 lbs.
Commercial ACL for Spanish Mackerel	ACL = 3,330,000 lbs.
Recreational ACL for Spanish Mackerel	ACL = 2,727,000 lbs.
Next Scheduled Quota Change	After assessment
Annual or averaged quota?	Annual
If averaged, number of years to average	-
Does the quota include bycatch/discard?	No

How is the quota calculated - conditioned upon exploitation or average landings?

Does the quota include bycatch/discard estimates? If so, what is the source of the bycatch/discard values? What are the bycatch/discard allowances?

The ABC, ACL, and recreational ACT values are based on landed catch only; discards are accounted for in specifying the ABC in terms of landed catch and not total mortality.

Are there additional details of which the analysts should be aware to properly determine quotas for this stock?

No.

2.6 Management and Regulatory Timeline

See attached tables below.

Table 2.5.8 Atlantic Migratory Group Spanish Mackerel Commercial Regulatory History prepared by: Christina Wiegand, SAFMC staff

Year	Quota (lbs ww)	ACL (lbs ww)	Days Open	Fishing Season	Reason for Closure	Season Start Date (first day implemented)	Season end Date (last day effective)	Size Limit	Size Limit Start Date	Size Limit End Date	Retention Limit (# fish)	Retention Limit Start Date	Retention Limit End Date

Notes:
1 Spanish mackerel managed as a single stock throughout the Gulf and South Atlantic.
2 Spanish mackerel managed as two migratory groups (Atlantic and Gulf migratory) from this point forward.
3 Management area extended from TX through NC to TX through NY.
4 Stock quota
5 Separate Northern (20%) and Southern Zone (80%) quotas.

Trip Limit Codes:
a Northern Zone (north of Florida/Georgia): 3,500
b Southern Zone (east Florida): 1,500 pounds per vessel per day from April 1 to November 30. From December 1 until 80% of quota is taken: unlimited harvest on Monday, Wednesday, and Friday; 1,500 pounds per vessel per day on Tuesday and Thursday; 500 pounds per vessel per day on Saturday and Sunday. Trip limit 1,000 pounds per vessel per day when 80% of quota is reached.
c Southern Zone (east Florida): 1,500 pounds per vessel per day from April 1 to November 30. From December 1 until 80% of quota is taken: unlimited harvest on Monday, Wednesday, and Friday; 1,500 pounds per vessel per day on Tuesday and Thursday; 500 pounds per vessel per day on Saturday and Sunday. Trip limit 1,000 pounds per vessel per day when 75% of quota is reached.
d Southern Zone (east Florida): 1,500 pounds per vessel per day from April 1 to OCtober 31. From November 1 until 80% of quota is taken: unlimited harvest on Monday, Wednesday, and Friday; 1,500 pounds per vessel per day on Tuesday and Thursday; 1,500 pounds per vessel per day on Saturday and Sunday. Trip limit 1,500 pounds per vessel per day when 75% of quota is reached.
e Southern Zone (east Florida): April 1 to November 30 would be 3,500 lb; from December 1 until 75% of the adjusted quota is taken there would be no trip limit on Monday through Friday and on Saturday and Sunday the trip limit would be 1,500 lbs.
f Northern Zone (north of North Carolina/South Carolina): 3,500
g Southern Zone (SC, GA, east FL): 3,500lbs until 75% adjusted quota is met, then 1,500lbs until adjusted quota is met and then 500lbs until the full quota is met.

2.7 State Regulatory History

Provided by the Atlantic States Marine Fisheries Commission

Table 2.2a. State Regulatory History – North Carolina and South Carolina as provided by the state management agencies.

Description of Action	State	Effective Date
1500 pounds max per day, land and sell aggregate king and Spanish mackerel combined	NC	08/04/80
2000 pounds max per day, land and sell aggregate king and Spanish mackerel combined	NC	10/01/81
3500 pounds max per day, land and sell aggregate king and Spanish mackerel combined	NC	10/01/82
Proclamation authority established to specify areas, seasons, quantity, means/methods, size limits	NC	12/01/87
Creel limit: 10 fish/person/fishing trip by hook and line	NC	6/15/88
Creel limit: 10 fish/person/fishing trip by hook and line unless person is in possession of Federal Permit to fish on Spanish mackerel quota. Charter boats with federal Coastal migratory Charter Permit shall not exceed 10 fish per person with more than 3 person on board including captain and mate.	NC	6/22/88
All coastal waters closed to harvest and retention of king and Spanish mackerel taken by any method. Proclamation expires 3/31/89	NC	3/7/89
Creel limit: 10 fish/person/dishing trip by hook and line unless person is in possession of Federal Permit to fish on Spanish mackerel quota. Charter boats with federal Coastal migratory Charter Permit shall not exceed 10 fish per person with more than 3 person on board including captain and mate. Creel limits do not apply to commercial fishermen using nets. Proclamation expires 3/31/90	NC	5/9/89
Creel limit: 10 fish/person/dishing trip by hook and line unless person is in possession of Federal Permit to fish on Spanish mackerel quota. Charter boats with federal Coastal migratory Charter Permit shall not exceed 10 fish per person with more than 3 person on board including captain and mate. Creel limits do not apply to commercial fishermen using nets.	NC	4/1/90
It is unlawful to have a purse gill net on board a vessel when taking or landing Spanish or King Mackerel.	NC	1/1/91
Commercial season closes, reopens 4/1/92	NC	1/5/92

Table 2.2a. State Regulatory History – North Carolina and South Carolina as provided by the state management agencies. Continued

12 inch FL minimum size.	NC	2/15/94
Creel limit: 10 fish/person/dishing trip by hook and line unless person is in possession of Federal Permit to fish on Spanish mackerel quota. Charter boats with federal Coastal migratory Charter Permit shall not exceed 10 fish per person with more than 3 person on board including captain and mate. Creel limits do not apply to commercial fishermen using nets except as specified by NCAC 3M/.0301.	NC	2/15/94
Proclamation authority for hook and line deleted. Entered into rule: Creel limit: 10 fish/person/dishing trip by hook and line unless person is in possession of Federal Permit to fish on Spanish mackerel quota. Charter boats with federal Coastal migratory Charter Permit shall not exceed 10 fish per person with more than 3 person on board including captain and mate	NC	3/1/96
Temporary rule change: Recreational purpose wording added and commercial gear working changed to commercial fishing operation. 12 inch minimum size Creel limit: 10 fish per person per day if taken by hook & line or for recreational purpose Holders of valid federal permits may exceed creel limit. Charterboats with valid federal permits shall not exceed 10 fish per person while fishing with more than 3 persons on board including captain and mate.	NC	7/1/99
It is unlawful to possess more than 15 Spanish mackerel per person per day taken for recreational purposes. It is unlawful to possess more than 15 Spanish mackerel per person per day in the Atlantic Ocean beyond three miles in a commercial fishing operation except for persons holding a valid National Marine Fisheries Service Spanish Mackerel Commercial Vessel Permit.	NC	4/1/01
Full consistency with federal regulations	SC	06/88-2007

Table 2.2b. State Regulatory History - North Carolina through Florida for Spanish mackerel as of 1990 as recorded in the Fishery Management Plan for Spanish Mackerel, Fishery Management Report No. 18, Atlantic States Marine Fisheries Commission, November 1990.

State	Bag Limit	Size Limit	Other
NC	10 fish	none	3,500 lb commercial trip limit
SC	10 fish	12" FL min.	Season closes with EEZ closure
GA	10 fish	12" FL min.	Recreational season open 3/16-11/30; 5% size tolerance by weight on trawlers
FL	5 fish	12" FL min.	1,850,000 lb quota for power assisted gill nets; season: Dec 15-Oct31. 205,000lb quota for all other forms of commercial fishing gears; season: Nov 1-Oct 31. 3 1/2 inch minimum stretched mesh.

Table 2.2c. State Regulatory History - New York through Florida, for Spanish Mackerel at specific times as taken from annual ASMFC FMP Reviews for Spanish Mackerel.

As of December 1995

State	Bag Limit	Size Limit	Other
NJ	10 fish	14" TL min.	
DE	10 fish	14" TL min.	
MD	10 fish	14" TL min.	Declaration allowing regulation through framework. Gill net mesh sizes for Chesapeake Bay.
VA	10 fish	14" TL min.	Size limit exemption for pound net fishery; closure when quota reached; 3500 lb trip limit.
NC	10 fish	12" FL min.	3,500 lb commercial trip limit (Spanish and king mackerel combined); finfish excluder devices required in shrimp trawls. Purse gill net prohibition.
SC	10 fish	12" FL min.	3,500 lb commercial trip limit tracking by reference the federal FMP.
GA	10 fish	12" FL min.	Season closed December 1 - March 15.

State	**Recreational**	**Commercial**	**Regulation Changes**
NY	14" TL, 15 fish	14" TL. 3,500 lb trip limit.	*North Carolina*
NJ	14" TL, 10 fish	14" TL. 3,500 lb trip limit.	One proclamation was issued under rule 15A NCAC 03M .0512 to remain in compliance with the Atlantic States Marine Fishery Commission. Addendum I to the Omnibus Amendment establishes a pilot program that would allow states to reduce the Spanish mackerel minimum size limit for the commercial pound net fishery to 11 ½ inches during the summer months of July through September. The measure is intended to reduce waste of these shorter fish, which are discarded dead in the summer months, by converting them to landed fish that will be counted against the quota. The Division issued a proclamation suspending the 12-inch fork length size limit and adopting the 11 ½ inch fork length size limit in the commercial pound net fishery from July 4, 2016 to September 30, 2016.
DE	14" TL, 15 fish	14" TL. 3,500 lb trip limit.

All information included in the previous tables were pulled from the annual state FMP compliance reports (NY-FL), and reported in annual ASMFC FMP Reviews for Spanish Mackerel.

3. Assessment History

Full stock assessments of the south Atlantic Spanish mackerel were conducted by Powers et al. (1996), Legault et al. (1998) and the Sustainable Fisheries Division (2003 and 2007). Historically, the Mackerel Stock Assessment Panel (MSAP) met regularly to oversee and review these assessments and provide advice to the SAFMC and GMFMC.

The most recent full stock assessment for south Atlantic Spanish mackerel was conducted in 2007 in SEDAR 17 using three separate models: ASPIC , BAM, and SRA. The SEDAR 17 Review Panel was presented with a base model using BAM, as neither ASPIC nor SRA were considered appropriate to produce standalone representations of the stock dynamics. The BAM was used with the following as input data: five fisheries and their corresponding age and length compositions, three fishery discard series, shrimp bycatch, seven fishery-dependent indices, two fishery-independent indices, one combined index and discard mortality rates. The base run was configured as a two sex model incorporating differences in growth by sex. Natural mortality was constant through time, but varied by age. The panel did not accept the base model of the assessment as appropriate for making biomass determinations. They concluded that there is an overall increasing trend in biomass, but that a biomass decline was observed from 2003 to 2007. The panel noted that the fishing mortality at the terminal year of the model (2007) did not seem to be inhibiting stock growth. Although the panel did not accept the model conclusions regarding biomass, they accepted model results that the stock was not undergoing overfishing. The panel remarked that the major issues with the assessment were the shrimp bycatch uncertainty, the historical recreational catch derivation, and the lack of an objective likelihood weighting method. The assessment previous to SEDAR 17 was in 2003 through the Mackerel Stock Assessment
Panel (MSAP), which included data through the 2001/2002 fishing year (Sustainable Fisheries Division 2003). Estimated fishing mortality for Atlantic group Spanish mackerel was found to be below FMSY and FOY since 1995. Estimated stock abundance had increased since 1995 and was found to be at a high for the analysis period. Probabilities that the Spanish mackerel was overfished were less than 1% and that overfishing had occurred in the most recent fishing year of the assessment were 3%; therefore, the MSAP concluded that south Atlantic Spanish mackerel was not overfished and overfishing did not occur in 2002/2003.

SEDAR-28 (SEDAR-28, 2012) was a benchmark assessment using the Beaufort Assessment Model (BAM) with data through 2011. BAM is an integrated catch-age model, and is customizable to the multiple data sources available (Williams and Shertzer, 2015). A surplus production model implemented with the ASPIC software (Prager 1994, Prager 2004 was used as a complement for comparison purposes. Based on the assessment provided from the BAM, the Review Panel concluded

that the stock was not overfished and not undergoing overfishing. The stock biomass status in the base run from the BAM was estimated to be SSB2011/MSST=2.29. The level of fishing (exploitation rate) was F2009-2011/FMSY = 0.526, with F2011/FMSY = 0.521. The qualitative results on terminal stock status were similar across presented sensitivity runs, indicating that the stock status results were robust given the provided data and can be used for management. The outcomes of sensitivity analyses done with BAM were in general agreement with those of the Monte Carlo Bootstrap Ensemble analysis (an additional way to examine uncertainty) in BAM. In general, stock status results from ASPIC were qualitatively similar to those from BAM.

1. Introduction

This operational assessment evaluated the stock of Spanish mackerel (*Scomberomorus maculatus*) in the South Atlantic region of the southeastern United States. The primary objectives were to update and improve the 2012 SEDAR 28 benchmark assessment of and to conduct new stock projections. Using data through 2011, SEDAR 28 had indicated that the stock was not overfished and not undergoing overfishing. For this SEDAR 78 assessment, data compilation and assessment methods were guided by methodology of SEDAR 28, as well as by current SEDAR practices and recommendations by the SEDAR 28 review panel. The assessment period is 1986–2020.

Available data on this stock included indices of abundance, landings, discards, and samples of annual age compositions from fishery dependent sources. Three indices of abundance were fitted by the model: one from the Florida commercial trip tickets, one from the recreational MRIP intercepts for harvested fish, and one from the age-0 SEAMAP Coastal Trawl Survey. Data on landings and discards were modeled from five distinct fleets and two bycatch series: commercial handline, commercial gillnet, commercial pound net, commercial cast net, and general recreational (shore, private and charter modes) landings and discards.

The primary model used in SEDAR 28—and the one updated here—was the Beaufort Assessment Model (BAM), an integrated statistical catch-age formulation. A base run of BAM was configured to provide point estimates of key management quantities, such as stock and fishery status. Uncertainty in estimates from the base run was evaluated through a mixed Monte Carlo/Bootstrap Ensemble (MCBE) procedure. Median values from the uncertainty analysis are also provided. Sensitivity runs were developed to evaluate the model at the MCBE bounds for fixed natural mortality, steepness, and general recreational discard mortality parameters as well as exclusion of the commercial handline index.

The assessment estimated that spawning stock has fluctuated on a near-decadal cycle near or above the minimum stock size threshold (MSST) level. The base-run estimate of terminal (2020) spawning stock was above the MSST ($SSB_{2020}/MSST = 1.40$), as was the median estimate from the MCBE ($SSB_{2020}/MSST = 1.42$). The estimated fishing rate has been at or below the maximum fishing mortality threshold (MFMT), represented by F_{MSY} with the exception of the terminal year (2020). The terminal estimate, which is based on a three-year geometric mean, was below F_{MSY} in the base run ($F_{2018–2020}/ F_{MSY} = 0.77$) and in the median of the MCBE ($F_{2018–2020}/ F_{MSY} = 0.74$). Thus, this assessment indicated that the stock is not experiencing overfishing. However, this result requires caution: if the overfishing rate of 2020 continued in 2021, the geometric mean would indicate overfishing.

The MCBE analysis illustrated that these estimates of stock and fishery status are robust. Of all MCBE runs, 92.6% were in agreement that the stock is not overfished, and 90.0% were in agreement that overfishing is not occurring. Although qualitative results were robust, the primary sources of uncertainty in quantitative results (i.e., degree of overfishing or overfished) was natural mortality and steepness.

The estimated trends of this operational assessment were quite similar to those from the SEDAR28 benchmark. However, the two assessments did show some differences in results, which was not surprising given several modifications made to both the data and the model (described throughout the report). The two assessments showed similar stock status between 1986 and 2011, the terminal year of SEDAR28. Since then, SEDAR 78 indicated that the Spanish mackerel stock has fluctuated near the MSY reference point.

1.1 Workshop Time and Place

The SEDAR 78 South Atlantic Spanish Mackerel assessment took place over a series of webinars held from May 2021 to March 2022.

1.2 Terms of Reference

1. Update the approved SEDAR 28 Spanish Mackerel model with data through 2020. Apply the current BAM configuration incorporating approved improvements developed since SEDAR 28.
2. Evaluate and document the following specific changes in input data or deviations from the benchmark model.
    - Update growth and reproductive models if additional samples are available for fish below 275 mm
    - If available, include any improved information on steepness for similar pelagic species.
    - Evaluate data uncertainty with respect to the recreational landings
    - Calculate different F metrics (in addition to apical F) (to address shifts in the age of apical F towards the end of the assessment time series).
3. Document any changes or corrections made to model and input datasets and provide updated input data tables. Provide commercial and recreational landings and discards in pounds and numbers.
4. Update model parameter estimates and their variances, model uncertainties, estimates of stock status and management benchmarks, and provide the probability of overfishing occurring at specified future harvest and exploitation levels.
5. Convene a working group including SSC representatives to meet via webinar, as needed to review model development relative to terms of reference 1 through 4.
6. Develop a stock assessment report to address these ToRs and fully document the input data, methods, and results.

1.5 Statements Addressing Each Terms of Reference

Note: Original ToRs are in normal font. Statements addressing ToRs are in italics.

1. Update the approved SEDAR 28 Spanish mackerel model with data through 2020. Apply the current BAM configuration incorporating approved improvements developed since SEDAR 28.

SEDAR78 applied the current BAM configuration. The assessment model structure and data sources were very similar to those used in SEDAR28. Important modifications, such as selectivity functions were investigated through likelihood profiles and visual comparisons of model fit to the data. The decision to remove sex-specific growth and selectivity and modify the start year for the model were evaluated and shown to improve model performance.

2. Evaluate and document the following specific changes in input data or deviations from the benchmark model.

    - Update growth and reproductive models if additional samples are available for fish below 275 mm.
    - If available, include any improved information on steepness for similar pelagic species.
    - Evaluate data uncertainty with respect to the recreational landings.
    - Calculate different F metrics (in addition to apical F) (to address shifts in the age of apical F towards the end of the assessment time series).

All the above bullet points were addressed. Growth models were developed with increased age-0 samples primarily from the SEAMAP Coastal Trawl Survey. There was very limited reproduction information. There was no new information on steepness that could be applied in this assessment. Likelihood profiles on steepness had similar results to SEDAR28. Uncertainty in recreational landings was presented in the associated working paper. Years with large increases, such as 2020, were evaluated and discussed in greater detail. The spawning potential ratio conditional on annual F and exploitation rates were examined as additional F metrics.

3. Document any changes or corrections made to model and input datasets and provide updated input data tables. Provide commercial and recreational landings and discards in pounds and numbers.

Changes to data and model are documented in the report, along with tables of updated data input and removals in both pounds and numbers.

4. Update model parameter estimates and their variances, model uncertainties, estimates of stock status and management benchmarks, and provide the probability of overfishing occurring at specified future harvest and exploitation levels.

All of these key estimates and outputs are documented in the report.

5. Convene a working group including SAFMC Science and Statistical Committee representatives to meet via webinar, as needed to review model development relative to terms of reference 1 through 4.

The SEDAR78 panel did not suggest working groups were needed during model development.

6. Develop a stock assessment report to address these TORs and fully document the input data, methods, and results.

Please see this report.

2 Data Review and Update

The input data for this assessment are described below, with focus on modifications from the SEDAR 28 benchmark assessment.

2.1 Data Review

In this operational assessment, the Beaufort assessment model (BAM) was fitted to data sources developed during the SEDAR 78 process, evaluated over several webinars. These data include updates to SEDAR 78 data, where appropriate, which are highlighted below.

Model inputs used in SEDAR 28 and SEDAR 78

- Life history: Meristics, population growth, fishery dependent size at age, female size at age, female maturity, proportion female, age-dependent natural mortality
- Landings and discards: Commercial handline, gillnet, pound net, and cast net combined landings and discards, shrimp bycatch, general recreational landings and discards
- Indices of abundance: Commercial handline, MRIP, SEAMAP YOY [1]
- Age compositions: Commercial handline, gillnet, pound net, and cast net landings, and general recreational landings
- Other: General recreational discard mortality

Updated data sources in SEDAR 78

- Life history: Population growth, fishery dependent size at age, female size at age, age-dependent natural mortality
- Landings and discards: Commercial handline, gillnet, pound net, and cast net combined landings and discards, shrimp bycatch, general recreational landings and discards
- Indices of abundance: Commercial handline, MRIP, SEAMAP YOY
- Age compositions: Commercial handline, gillnet, pound net, cast net, and general recreational

2.2 Data Update

2.3 Life History

A total of 32,348 (1986 — 2020) Spanish mackerel ages were prepared for SEDAR 78. Several data sources reevaluated age sample information for the entire time series. Gear identification was improved for some fishery dependent samples and deemed unreliable for others. In addition, many more YOY samples were collected since SEDAR 28 primarily from the SEAMAP Coastal Trawl Survey (see SCDNR sample sizes, mostly age–0 and age–1 fish, in SEDAR78-WP08 (2021)).

Estimates of the von Bertalanffy growth parameters updated for the population as a whole ($L_\infty = 582.5$ mm, $K = 0.6$ yr^{-1}, and $t_0 = -0.5$ yr), the female population ($L_\infty = 610.1$ mm, $K = 0.62$ yr^{-1}, and $t_0 = -0.5$ yr), and the fished

[1] Abbreviations and acronyms used in this report are defined in Appendix A

population (L_∞ = 680.4 mm, K = 0.2 yr^{-1}, and t_0 = −2.77 yr). For the population as a whole and the female population, the t_0 parameter was fixed, samples were weighted by the inverse of the number of samples at age, and a correction was applied for bias from fishery dependent samples (Diaz et al. 2004). Length at age for all growth models are given in Table 1.

Age–based (Lorenzen 1996) natural mortality estimates were updated using new population growth parameters for SEDAR 78. As in SEDAR28, the cumulative survival of age 2+ based on a point estimate of natural mortality, 0.35, was used to scale the age–based estimates of natural mortality (Table 1).

2.4 Landings

The fleet structure used in SEDAR 78 was the same as that of SEDAR 28, including commercial handline, gill net, cast net, pound net, and general recreational (including estimates of headboat and MRIP private, charter, and shore–based landings). General recreational landings and discards were estimated using the current MRIP methodology (SEDAR78-WP03 2021). The commercial estimated landings were input as whole pounds. The commercial "other" estimated landings were divided between commercial gears based on the annual proportion of each (Table 2). General recreational landings were input in numbers (thousands).

2.5 Discards and Bycatch

Discards were estimated for commercial gill net, handline, and trolling (included with handline) in numbers (SEDAR78-WP11 2021). The commercial discards were converted to pounds based on the average weight of fish less than the 12 inch size limit weighted by the observed proportion in the overall length composition. These minor removals were then combined with their respective catch time series. General recreational discards were estimated in numbers and were modeled separately as in SEDAR 28 (Table 2, SEDAR78-WP03 (2021)). Spanish mackerel are observed in the shrimp trawl fishery in the South Atlantic. Shrimp bycatch estimates were developed using methods consistent with SEDAR 28 (SEDAR78-WP04 2021). General recreational discards and shrimp bycatch were developed in numbers as input to the model (Table 2).

2.6 Indices of Abundance

Two fishery dependent indices and one fishery independent recruitment index were developed for SEDAR 78. The general recreational MRIP index and associated CVs for harvested fish were updated through 2020 (SEDAR78-WP09 2021). This index was later truncated to start in 1986 and renormalized to its mean to coincide with the start year of the model. An index from Florida commercial handline trip ticket records was developed (SEDAR78-WP12 2021). A recruitment index of age–0 fish from the SEAMAP Coastal Trawl Survey was formulated for 1989–2019 (SEDAR78-WP01 2021; SEDAR78-WP02 2021). All finalized indices for potential use in the Spanish mackerel stock assessment and associated CVs are in Table 3.

2.7 Length Composition

As in SEDAR 28, length data were not used to inform the model. However, length compositions can be used to remove bias in samples collected for age determination. Only the commercial gillnet collections had adequate samples to develop weighted length composition data (SEDAR78-WP05 2021). This composition was developed solely to weight the commercial gillnet age composition.

2.8 Age Composition

Age data were available from the commercial handline, pound net, gill net, cast net and general recreational sampling programs. Nominal age compositions were developed for Spanish mackerel except commercial gillnet which was weighted by the length composition (Chih 2009; SEDAR78-WP05 2021). Ages greater than 10 were pooled to age 10 creating a plus group (age 10+; Tables 4–8).

3 Stock Assessment Methods

3.1 Overview

This operational assessment updated the primary model applied in SEDAR28 (2012), an integrated model implemented using the BAM software (Williams and Shertzer 2015). BAM applies a statistical catch-age formulation, coded in AD Model Builder (Fournier et al. 2012). BAM is referred to as an integrated model because it uses multiple data sources relevant to population and fishery dynamics (e.g. removals, length and age compositions, and indices of abundance) in a single framework. In essence, the catch-age model simulates a population forward in time while including fishing processes (Quinn and Deriso 1999; Shertzer et al. 2008). The model is similar in structure to Stock Synthesis (Methot and Wetzel 2013) and other stock assessment models used in the United States (Dichmont et al. 2016; Li et al. 2021). Versions of BAM have been used in previous SEDAR assessments of reef fishes in the U.S. South Atlantic, such as black sea bass, blueline tilefish, gag, greater amberjack, red grouper, red porgy, snowy grouper, tilefish, and vermilion snapper, as well as in the previous SEDAR assessments of Spanish mackerel (SEDAR17 2008; SEDAR28 2012). The primary model in this assessment was a statistical catch-age model (Quinn and Deriso 1999), implemented with the AD Model Builder software (ADMB Foundation 2012). Statistical catch-age models share many attributes with ADAPT-style tuned and untuned VPAs.

3.2 Data Sources

The catch-age model was fit to data from one fishery independent recruitment index, two fishery dependent indices, estimates of bycatch in the shrimp fishery, and to data from each of the five primary fisheries on southeastern U.S. Spanish mackerel: commercial gill net, commercial pound net, commercial cast net, commercial handlines (including hook & line, trolling, and electric reels), and general recreational (including headboat). These data included annual landings by fishery (in total weight for commercial and in numbers for general recreational and shrimp bycatch), annual discards from the general recreational sector, and annual age composition of landings by fishery. Discards from the commercial fisheries were added to landings as they were not a large enough proportion of total catch to model separately (Table 2). Data on annual discard mortalities were not available, but an overall discard mortality rate of 0.2 for the general recreational sector was applied to total discards as per the recommendation of the SEDAR 28 DW. All shrimp bycatch was assumed dead.

3.3 Model Configuration

The assessment time period was 1986–2020. The initial year was modified from SEDAR 28 to begin when adequate information was available to inform the initial age structure of the population and fishing rates. These values were assumed and fixed in SEDAR 28 and age compositions are not available until 1990. SEDAR 28 had to make assumptions about population age structure and fishing mortality to initialize the model in 1950. The terminal year extended from 2012 to 2020. A general description of the assessment model follows.

3.4 Stock Dynamics

In the assessment model, new biomass was acquired through growth and recruitment, while abundance of existing cohorts experienced mortality from fishing and natural sources. The population was assumed closed to immigration and emigration. The model included age classes $0-10^{+}$, where the oldest age class 10^{+} allowed for the accumulation of fish (i.e., plus group).

3.5 Initialization

Initial (1986) numbers at age assumed the stable age structure computed from expected recruitment and the initial, age-specific total mortality rate. That initial mortality was the sum of natural mortality and fishing mortality, where fishing mortality was the product of an initial fishing rate (F_{init}) and F-weighted selectivity based on starting year landings. The initial fishing rate was estimated using a starting value of $F_{\text{init}} = 0.5$ and no prior. The initial recruitment in 1986 was estimated.

3.6 Natural Mortality Rate

The natural mortality rate (M) was assumed constant over time, but decreasing with age. The form of M as a function of age was based on Lorenzen (1996). The Lorenzen (1996) approach inversely relates the natural mortality at age to mean weight at age W_a by the power function $\mathrm{M}_a{=}\alpha W_a^{\beta}$, where α is a scale parameter and β is a shape parameter. Lorenzen (1996) provided point estimates of α and β for oceanic fishes, which were used for this assessment. As in previous SEDAR assessments, the age-dependent estimates of M_a were rescaled to provide the same fraction of fish surviving from age 2 through the oldest observed age (12 yr) as would occur with constant $M = 0.35$, which is consistent with the findings of Hoenig (1983) and discussed in Hewitt and Hoenig (2005). The scaled Lorenzen estimator has become common in SEDAR assessments as the most reliable approach to infer age-dependent natural mortality.

3.7 Growth

Mean size at age of the population, female population, and fishery removals under a 12-inch size limit (fork length, FL) were modeled with the von Bertalanffy equation, and weight at age (whole weight, WW) was modeled as a function of FL (Figure 1, Table 1). Parameters of growth and conversions (FL-WW) were treated as input to the assessment model.

3.8 Female Maturity and Sex Ratio

Female maturity was modeled with a logistic function; parameters for this model and a vector of maturity at age were provided by the SEDAR 28 DW and treated as input to the assessment model (Table 1). The sex ratio was assumed to be 50:50, as in SEDAR 28.

3.9 Spawning Biomass

Spawning biomass (in units of mt) was modeled as the mature female biomass. It was computed each year from number at age when spawning peaks. For Spanish mackerel, peak spawning was considered to occur on June 1^{st}.

3.10 Recruitment

Recruitment was predicted from spawning biomass using a Beverton–Holt spawner-recruit model. These stock-recruit parameters are median-unbiased values (Li et al. 2021). For all years in the model (1986–2020), estimated recruitment was conditioned on the Beverton–Holt model. Steepness was fixed at 0.75 for the base run.

3.11 Landings

Time series of landing from five fisheries were modeled: commercial handlines, commercial gillnet, commercial pound net, commercial cast net, and general recreational (including headboat). Landings were modeled via the Baranov catch equation (Baranov 1918), in units of 1000 lb whole weight for commercial fisheries and in units of 1000 fish for the general recreational fishery and bycatch.

3.12 Discards

Starting in 1986 with the implementation of size-limit regulations, time series of discard mortalities (in units of 1000 fish) were available for commercial handline and gill net fisheries. The magnitude of the commercial discards was trivial in comparison to the landings. As a result, the commercial discards were included with the landings rather than model the discards separately. General recreational discards were modeled seperately and decremented by the discard mortality rate (0.2) determined in SEDAR 28. As with landings, discard mortalities were modeled via the Baranov catch equation (Baranov 1918), which required estimates of discard selectivities (described below) and release mortality rates.

3.13 Bycatch

Spanish mackerel are observed in the shrimp trawl fishery in the South Atlantic. However, the observer coverage is extremely sparse and effort data are questionable. Estimates were provided by the data workshop that assumed a constant relationship over time between the rate of bycatch and effort by state (SEDAR78-WP04 2021). Bycatch was modeled via the Baranov catch equation (Baranov 1918), assuming that only age 0 fish and a small proportion of age 1 fish were selected with 100% mortality.

3.14 Fishing

For each time series of landings and discard mortalities, a separate full fishing mortality rate (F) was estimated. Age-specific rates were then computed as the product of full F and selectivity at age. The across-fleet annual F was represented by apical F, computed as the maximum of F at age summed across fleets.

3.15 Selectivities

Selectivity curves applied to landings were estimated using a parametric approach. This approach applies plausible structure on the shape of the curves, and achieves greater parsimony than occurs with unique parameters for each age. Flat-topped selectivities were modeled as a two-parameter logistic function (logistic). Dome-shaped selectivities were modeled by combining two logistic functions: a two-parameter logistic function to describe the ascending limb of the curve, and a two-parameter logistic function to describe the descending limb (double–logistic). Another type of domed–shaped selectivity allowed for a freely estimated logit parameter for age–0, a fixed peak at age–1, and an exponential decline for age 2^+ (logit–exponential).

To model landings, this assessment applied flat-topped selectivity for the commercial handline and cast net fleets, both pooled over years due to small sample sizes. Dome-shaped selectivity was used to model commercial gillnet landings. Commercial pound net and general recreational fleets were modeled using the logit–exponential selectivity. The approach to modeling each of these fleets was modified from decisions in SEDAR 28 to improve model fit and stability and based on total likelihood or likelihood profiles of specific parameters.

Selectivities of general recreational discards and shrimp bycatch could not be estimated directly, because composition data of discards were lacking. Fixed selectivities for these removals were the same as in SEDAR 28.

3.16 Indices of Abundance

The model was fit to two fishery dependent indices of relative abundance (MRIP (1986–2020) and commercial handline (1986–2020)), and one fishery independent index of age–0 recruitment (SEAMAP YOY (1989–2019)). The fishery dependent indices of abundance were limited to harvested fish. Predicted indices were conditional on selectivity of the corresponding fleet, and were computed from abundance (numbers of fish) at the midpoint of the year or, in the case of commercial handlines, biomass.

3.17 Catchability

In the BAM, catchability scales indices of relative abundance to the estimated population at large, adjusted by selectivity of the fleet or survey. For SEDAR 78, as in SEDAR 28, catchability (q) of each index was assumed to be time-invariant, and these parameters (one q per index) were estimated within BAM.

3.18 Biological Reference Points

Biological reference points (benchmarks) were calculated based on maximum sustainable yield (MSY) estimates from the Beverton–Holt spawner-recruit model with bias correction (expected values in arithmetic space). Computed benchmarks included MSY, fishing mortality rate at MSY (F_{MSY}), and spawning stock at MSY ($\mathrm{SSB}_{\mathrm{MSY}}$). In this assessment, spawning stock measures total biomass (mt) of mature females. These benchmarks are conditional on the estimated selectivity functions. The selectivity pattern used here were the selectivities at age (weighted by apical F), with effort from each fishery (including discard and bycatch mortalities) estimated as the full F averaged over the last three years of the assessment.

3.19 Fitting Criterion

Model parameters were estimated using a penalized likelihood approach in which observed removals (landings and discards) were fit closely, and observed composition data and abundance indices were fit to the degree that they were compatible. Removals and index data were fit using lognormal likelihoods. Age composition data were fit using the Dirichlet-multinomial likelihood, and only from years that met minimum sample size criteria ($nfish > 10$ and $ntrips \geq 10$.

SEDAR 28 fit composition data using the robust multinomial with iterative re-weighting (Francis 2011). Since Francis (2011), additional work on this topic has questioned the use of the multinomial distribution in stock assessment models (Francis 2014), and has recommended the Dirichlet-multinomial as an alternative (Francis 2017; Thorson et al. 2017; Fisch et al. 2021). A chief advantage of the Dirichlet-multinomial is that it is self-weighting through estimation of an additional variance inflation parameter for each composition component, making iterative re-weighting unnecessary. Another advantage is that it can better account for overdispersion, or, larger variance in the data than would be expected by the multinomial. Overdispersion can result from intra-haul correlation, which results when fish caught in the same set are more alike in length or age than fish caught in a different set (Pennington and Volstad 1994). The Dirichlet-multinomial has been implemented in Stock Synthesis (Methot and Wetzel 2013; Thorson et al. 2017) and in the BAM, and since SEDAR 41 has become the standard likelihood for fitting composition data in assessments of South Atlantic fishes.

The model includes the capability for each component of the likelihood to be weighted by user-supplied values. When applied to indices, these weights modifed the effects of the CVs derived from index standardization. CVs from index standardization are often smaller for fishery dependent indices than for fishery independent indices due to the typically larger sample sizes. Therefore, initial CVs for the fishery dependent indices were set to 0.2, similar to past SEDAR assessments, to ensure that the fishery independent index was not considered less certain than the fishery dependent index. In the base run, weights on the indices were adjusted iteratively from the initial values based on the index standardization (Table 3) until standard deviations of normalized residuals (SDNRs) were near 1.0, as recommended by Francis (2011).

For some parameters defining selectivities and Dirichlet-multinomial overdispersion parameters, normal priors were applied to maintain parameter estimates near reasonable values, and to prevent the gradient-based optimization routine from drifting into parameter space with negligible changes in the likelihood.

3.20 Configuration of a Base Run

The base run was configured as described above. This configuration does not necessarily represent reality better than all other possible configurations, and thus this assessment attempted to portray uncertainty in point estimates through sensitivity analyses and through a MCBE approach (described below).

3.21 Sensitivity Analyses

Sensitivity runs were chosen to investigate issues that arose specifically with this operational assessment. They were intended to demonstrate directionality of results with changes in inputs or simply to explore model behavior. These model runs vary from the base run as follows:

- S1: Removal of the commercial handline index
- S2: Use the Lorenzen M scaled to the low point estimate of M

- S3: Use the Lorenzen M scaled to the high point estimate of M
- S4: Steepness fixed at 0.6
- S5: Steepness fixed at 0.9
- S6: General recreational discard rate fixed at 0.1
- S7: General recreational discard rate fixed at 0.3

Retrospective analyses were also conducted by incrementally dropping one year at a time for five iterations. In these runs, the terminal years were 2019, 2018, 2017, 2016, or 2015.

3.22 Parameters Estimated

The model estimated annual fishing mortality rates of each fleet, selectivity parameters, catchability coefficients associated with indices, parameters of the mean recruitment model (R_0), annual recruitment deviations, and Dirichlet-multinomial variance inflation factors. Estimated parameters are listed in Appendix B.

3.23 Per Recruit and Equilibrium Analyses

Yield per recruit and spawning potential ratio were computed as functions of F, as were equilibrium landings, discards, and spawning biomass. Equilibrium landings and discards were also computed as functions of biomass B, which itself is a function of F. As in the computation of MSY-related benchmarks (described in §3.24), per recruit and equilibrium analyses applied the most recent selectivity patterns averaged across fleets, weighted by each fleet's F from the last three years of the assessment (2018–2020).

3.24 Benchmark/Reference Point Methods

In this assessment of Spanish mackerel, the quantities F_{MSY}, $\mathrm{SSB}_{\mathrm{MSY}}$, B_{MSY}, and MSY were estimated by the method of Shepherd (1982). In that method, the point of maximum yield is calculated from the spawner-recruit curve and parameters describing growth, natural mortality, maturity, and selectivity. The value of F_{MSY} is the F that maximizes equilibrium removals.

On average, expected recruitment is higher than that estimated directly from the spawner-recruit curve, because of lognormal deviation in recruitment. Thus, in this assessment, the method of benchmark estimation accounted for lognormal deviation by including a bias correction in equilibrium recruitment. The bias correction (ς) was computed from the variance (σ_R^2) of recruitment deviation in log space: $\varsigma = \exp(\sigma_R^2/2)$. Then, equilibrium recruitment (R_{eq}) associated with any F is,

$$R_{eq} = \frac{R_0\left[\varsigma 0.8h\Phi_F - 0.2(1-h)\right]}{(h-0.2)\Phi_F} \tag{1}$$

where R_0 is virgin recruitment, h is steepness, and $\Phi_F = \phi_F/\phi_0$ is spawning potential ratio given growth, maturity, and total mortality at age (including natural and fishing mortality rates). The R_{eq} and mortality schedule imply an equilibrium age structure and an average sustainable yield (ASY). The estimate of F_{MSY} is the F giving the highest ASY, and the estimate of MSY is that ASY. The estimate of $\mathrm{SSB}_{\mathrm{MSY}}$ follows from the corresponding equilibrium age structure, as does the benchmark estimate of discard mortalities (D_{MSY}), here separated from ASY (and consequently, MSY).

Estimates of MSY and related benchmarks are conditional on selectivity pattern. The selectivity pattern used here was an average of terminal-year selectivities from each fleet, where each fleet-specific selectivity was weighted in proportion to its corresponding estimate of F averaged over the last three years (2018–2020). If the selectivities or relative fishing mortalities among fleets were to change, so would the estimates of MSY and related benchmarks.

For this stock, the maximum fishing mortality threshold (MFMT) is defined by the SAFMC as F_{MSY}, and the minimum stock size threshold (MSST) as $75\%\mathrm{SSB}_{\mathrm{MSY}}$. Overfishing is defined as $F >$ MFMT and overfished as SSB $<$ MSST. Current status of the stock is represented by SSB in the latest assessment year (2020), and current status of the fishery is represented by the geometric mean of F from the latest three years (2018–2020).

3.25 Uncertainty and Measures of Precision

As in SEDAR 28, this assessment used a MCBE approach to characterize uncertainty in results of the base run. Monte Carlo and bootstrap methods (Efron and Tibshirani 1993; Manly 1997) are often used to characterize uncertainty in ecological studies, and the mixed approach has been applied successfully in stock assessment, including Restrepo et al. (1992), Legault et al. (2001), SEDAR4 (2004), and many South Atlantic SEDAR assessments since SEDAR19 (2009). The approach is among those recommended for use in SEDAR assessments (SEDAR Procedural Guidance 2010), and it is considered to be one of the more complete characterizations of uncertainty used in stock assessments across the United States.

The approach translates uncertainty in model input into uncertainty in model output, by fitting the model many times with different values of "observed" data and key input parameters. A main advantage of the approach is that the results describe a range of possible outcomes, so that the ensemble of models characterizes uncertainty in results more thoroughly than any single fit or handful of sensitivity runs (Scott et al. 2016; Jardim et al. 2021). A minor disadvantage of the approach is that computational demands are relatively high, but this can largely be mitigated through use of parallel processing.

In this assessment, the BAM was successively re-fit in $n = 4000$ trials that differed from the original inputs by bootstrapping on data sources, and by Monte Carlo sampling of several key input parameters. The value of $n = 4000$ was chosen because a minimum of 3000 runs were desired, and it was anticipated that not all runs would converge or otherwise be valid. Of the 4000 trials, approximately 1% were discarded, because the model did not properly converge (the Hessian was not positive definite or a parameter hit a bound). This left $n = 3957$ MCBE runs to characterize uncertainty, which was sufficient for convergence of standard errors in management quantities. All runs were given equal weight when forming the ensemble of results (Jardim et al. 2021).

The MCBE analysis should be interpreted as providing an approximation to the uncertainty associated with each output. The results are approximate for two related reasons. First, not all combinations of Monte Carlo parameter inputs are equally likely, as biological parameters might be correlated. Second, all runs are given equal weight in the results, yet some might provide better fits to data than others.

3.26 Bootstrap of Observed Data

To include uncertainty in time series of observed landings, discards, and indices of abundance, multiplicative lognormal errors were applied through a parametric bootstrap. To implement this approach in the MCB trials, random variables ($x_{s,y}$) were drawn for each year y of time series s from a normal distribution with mean 0 and variance $\sigma^2_{s,y}$ [that is, $x_{s,y} \sim N(0, \sigma^2_{s,y})$]. Annual observations were then perturbed from their original values ($\hat{O}_{s,y}$),

$$O_{s,y} = \hat{O}_{s,y}[\exp(x_{s,y} - \sigma^2_{s,y}/2)] \tag{2}$$

The term $\sigma_{s,y}^2/2$ is a bias correction that centers the multiplicative error on the value of 1.0. Standard deviations in log space were computed from CVs in arithmetic space, $\sigma_{s,y} = \sqrt{\log(1.0 + CV_{s,y}^2)}$. As used for fitting the base run, CVs of landings and discards were assumed to be 0.05, and CVs of indices of abundance were those provided by, or modified from, the DW (tabulated in §2 of this assessment report).

Uncertainty in age compositions were included by drawing new distributions for each year of each data source, following a multinomial sampling process. Ages of individual fish were drawn at random with replacement using the cell probabilities of the original data. For each year of each data source, the number of individuals sampled was the same as in the original data (number of fish).

3.27 Monte Carlo Sampling

In each successive fit of the model, several parameters were fixed (i.e., not estimated) at values drawn at random from distributions. The steepness, natural mortality, and general recreational discard mortality distributions are described below.

3.28 Steepness

As in SEDAR 28, steepness could not be estimated with stability in the model. Steepness values above 0.60 appeared to be equally likely in the likelihood profile. Steepness was fixed at 0.75 for the base run and uncertainty in the parameters was characterized by a truncated normal distribution with 0.6 and 0.9 as the lower and upper bounds respectively.

3.29 Natural Mortality

As in each model run, the vector of age-specific natural mortality (Lorenzen estimator) was scaled to the fish–only Hoenig (1983) age-invariant M as was done for the base run. The point estimate of natural mortality ($M = 0.35$) was based on a maximum age of 12. To estimate uncertainty, a new M value was drawn for each MCB trial from a truncated normal distribution of (range [0.30, 0.42]) with mean equal to the point estimate ($M = 0.35$) and standard deviation set to provide 95% confidence limits at the bounds. The range was reduced from SEDAR 28 and corresponds to maximum age $+/-2$ instead of the range of point estimates across many different methods to calculate M (range [0.16, 0.54]). Each realized value of M was used to scale the age-specific Lorenzen M, as in the base run.

3.30 General Recreational Discard Mortality

As in SEDAR 28, discard mortalities δ were subjected to Monte Carlo variation as follows. A new value for general recreational discard mortality was drawn for each MCB trial from a truncated normal distribution range [0.10, 0.30] with mean equal to the point estimate ($\delta = 0.20$) and standard deviation set to provide 95% confidence limits at the bounds.

3.31 Projection Methods

Projections were run to predict stock status in years after the assessment, 2021–2025.

The structure of the projection model was the same as that of the assessment model, and parameter estimates were those from the assessment. A single selectivity curve was applied to calculate landings computed by averaging selectivities across fleets using geometric mean Fs from the last three years of the assessment period, similar to computation of MSY benchmarks (§3.24).

3.31.1 Initialization of Projections

Although the terminal year of the assessment is 2020, the assessment model computes abundance at age (N_a) at the start of 2021. For projections, those estimates were used to initialize N_a. However, the assessment has no information to inform the strength of 2021 recruitment, and thus it computes 2021 recruits (N_1) as the expected value, that is, without deviation from the estimate of mean recruitment, and corrected to be unbiased in arithmetic space. In the stochastic projections, lognormal stochasticity was applied to these abundances after adjusting them to be unbiased in log space, with variability based on the estimate of σ_R. Thus, the initial abundance in year one (2021) of projections included this variability in N_1. The deterministic projections were not adjusted in this manner, because deterministic recruitment follows mean recruitment.

Fishing rates that define the projections were assumed to start in 2023. Because the assessment period ended in 2020, the projections required an initialization period (2021 and 2022). L_{current} (the average landings over the last 3 years in the assessment model) was assumed during the interim period.

3.31.2 Uncertainty of Projections

To characterize uncertainty in future stock dynamics, stochasticity was included in replicate projections, each an extension of a single assessment fit from the ensemble. Thus, projections carried forward uncertainties in natural mortality and discard mortality, as well as in estimated quantities such as spawner-recruit parameters (R_0 and σ_R, selectivity curves, and in initial (start of 2021) abundance at age.

Initial and subsequent recruitment values were generated with stochasticity using a Monte Carlo procedure, in which the estimated recruitment of each model within the ensemble is used to compute mean annual recruitment values ($\bar{R}_y$). Variability is added to the mean values by choosing multiplicative deviations at random from a lognormal distribution,

$$R_y = \bar{R}_y \exp(\epsilon_y). \tag{3}$$

Here ϵ_y is drawn from a normal distribution with mean 0 and standard deviation σ_R, where σ_R is the standard deviation from the relevant ensemble model component.

The procedure generated 20,000 replicate projections of models within the ensemble drawn at random (with replacement). In cases where the same model run was drawn, projections would still differ as a result of stochasticity in projected recruitment streams. Central tendencies were represented by the deterministic projections of the base run, as well as by medians of the stochastic projections. Precision of projections was represented graphically by the 5^{th} and 95^{th} percentiles of the replicate projections.

3.31.3 Projection Scenarios

The ToRs for this assessment did not define projections scenarios. The SEDAR 78 panel defined three scenarios: F_{current}, F_{MSY}, and $75\%F_{\text{MSY}}$. In each, the landings in the interim period (2021–2022) were calculated based on F_{current}.

- Scenario 1: $F = F_{\text{current}}$, with L_{current} also assumed for the interim period.
- Scenario 2: $F = F_{\text{MSY}}$, with L_{current} assumed for the interim period.
- Scenario 3: $F = 75\%F_{\text{MSY}}$, with L_{current} assumed for the interim period.

4 Stock Assessment Results

4.1 Measures of Overall Model Fit

In general, the BAM fit well to the available data. Predicted age compositions were reasonably close to observed data in most years (Figures 2 and 3). The model was configured to fit observed commercial and general recreational removals closely (Figures 4–10). Fits to indices of abundance were reasonable, though the commercial handline index was generally underfit between 2004 and 2020 (Figures 11–13). There was no clear explanation for this trend and a sensitivity run to evaluate the exclusion of the commercial handline index is discussed in 4.11. The SEAMAP YOY index suggests highly variable recruitment from year to year; however, mismatches between trawl surveys and the timing of migration are an alternative explanation for the variability.

4.2 Parameter Estimates

Estimates of all parameters from the catch-age model are shown in Appendix B. Estimates of management quantities and some key parameters are reported in sections below.

4.3 Stock Abundance and Recruitment

Estimated abundance at age shows a similar pattern across all years with most variation in youngest ages (Figure 14). Annual number of recruits is shown in Table 9 (age-0 column) and in Figure 15.

4.4 Total and Spawning Biomass

Estimated biomass at age follows a similar pattern as did abundance (Table 10 and Figure 16). Total biomass and spawning biomass show nearly identical trends with near–decadal fluctuation in overall landings. The relative contribution and annual variability of YOY fish is lower in the biomass at age due to non-linear size at age.

4.5 Fishery Selectivity

Selectivities of landings from commercial and general recreational fleets are shown in Figures 17, 18, 19, 20, and 21. Selectivities of discards from commercial and general recreational fleets are shown in Figures 22 and 23. Selectivities are tabulated in Table 12. Estimated selectivities of removals indicate that full selection occurs by age one for commercial pound net and general recreational fleets and age three for commercial handline, cast net, and gillnet fleets. General recreational discards and shrimp bycatch were assumed to be mostly YOY (Figures 23 and 23).

Average selectivities of landings, dead discards, and the total weighted average of all selectivities were computed from F-weighted selectivities in the most recent three assessment years (Figure 24, Table 12). These average selectivities were used in computation of point estimates of benchmarks, as well as in projections.

4.6 Fishing Mortality

Estimates of total F by fleet are shown in Figure 25 and Table 13, and estimates of F at age are shown in Table 14. In any given year, the maximum F at age (i.e., apical F) may be less than that year's sum of fully selected Fs across fleets. This inequality is due to the combination of two features of estimated selectivities: full selection occurs at different ages among gears and several sources of mortality have dome-shaped selectivity.

Alternative measures of fishing intensity have implications similar to those of apical F (Figure 26). The value of SPR_F has remained near or above the equilibrium MSY level with the exception of the terminal year which was dominated by removals from the general recreational fleet.

Throughout most of the assessment period, estimated landings and discard mortalities in number of fish have been split evenly between commercial and general recreational sectors (Figures 27 and 28). Early commercial landings were dominated by gillnet removals but shifted to a mix of cast net, gillnet, and handline starting in about 2004. Table 18 shows total landings at age in numbers, and Table 19 in 1000 lb. Table 20 shows total dead discards at age in thousand pounds, and Table 21 in weight.

4.7 Stock-Recruitment Parameters

The estimated Beverton–Holt spawner-recruit curve is shown in Figure 31. Variability about the curve was estimated only at relatively low levels of spawning biomass, because composition data required for estimating recruitment deviations became available only after spawning stock had been diminished. The effect of density dependence on recruitment can be examined graphically via the estimated recruits per spawner as a function of spawners (Figure 31).

The mean recruit relationship and variability around that mean are shown in Figure 31. Values of recruitment–related parameters were as follows: unfished YOY recruitment $\widehat{R_0} = 21939130$, and standard deviation of recruitment residuals in log space was fixed at $\sigma_R = 0.6$ (which resulted in bias correction of $\varsigma = 1.20$). Uncertainty in these quantities was estimated through the MCBE analysis (Figure 32).

4.8 Per Recruit and Equilibrium Analyses

Yield per recruit and spawning potential ratio were computed as functions of F. These computations applied the most recent selectivity patterns averaged across fleets, weighted by F from the last three years (2018–2020) (Figure 33).

As in per recruit analyses, equilibrium spawning biomass was computed as a function of F (Figure 34). Similarly, equilibrium biomass and removals are functions of F, allowing for their relationships to be depicted together (Figure 35).

4.9 Benchmarks / Reference Point

As described in §3.24, biological reference points (benchmarks) were derived analytically assuming equilibrium dynamics, corresponding to the estimated spawner-recruit curve with bias correction (Figure 31). This approach is consistent with methods used in rebuilding projections (i.e., fishing at F_{MSY} yields MSY from a stock size of $\mathrm{SSB}_{\mathrm{MSY}}$). $F_{\mathrm{OY}} = 75\%F_{\mathrm{MSY}}$ was considered as another possible values of F at optimum yield (OY). Standard errors of benchmarks were approximated as those from ensemble modeling §3.25.

Maximum likelihood estimates (base run) of benchmarks, as well as median values from MCBE analysis, are summarized in Table 22. Point estimates of MSY-related quantities were $F_{\mathrm{MSY}} = 0.52$ (y^{-1}), MSY = 8210.19 (1000 lb), $B_{\mathrm{MSY}} = 19588.3$ (mt), and $\mathrm{SSB}_{\mathrm{MSY}} = 6405.87$ (mature female biomass, mt). Median estimates were $F_{\mathrm{MSY}} = 0.52$ (y^{-1}), MSY = 8351.35 (1000 lb), $B_{\mathrm{MSY}} = 19820.72$ (mt), and $\mathrm{SSB}_{\mathrm{MSY}} = 6410.25$ (mature female biomass, mt). Distributions of these benchmarks from the MCBE analysis are shown in Figure 36.

4.10 Status of the Stock and Fishery

Estimated time series of stock status SSB/MSST showed a near–decadal fluctuation above MSST (Figure 37, Table 11). Base-run estimates of spawning biomass have remained above $\mathrm{SSB}_{\mathrm{MSY}}$. Current stock status was estimated in the base run to be $\mathrm{SSB}_{2020}/\mathrm{MSST} = 1.4$ and $\mathrm{SSB}_{2020}/\mathrm{SSB}_{\mathrm{MSY}} = 1.05$ (Table 22), indicating that the stock is not overfished. Median values from the MCBE analysis indicated similar results SSB/MSST= 1.42 and $\mathrm{SSB}/\mathrm{SSB}_{\mathrm{MSY}}$= 1.07 (Figure 37). The uncertainty analysis suggested that the terminal estimate of stock status is robust (Figures 38 and 40). Of the MCBE runs, 92.6% indicated that the stock was above MSST in 2020.

The estimated time series of F/F_{MSY} suggests that overfishing has not occurred throughout most of the assessment period except for 2020 (Table 11, Figure 37). Current fishery status in the terminal year, with current F represented by the geometric mean from years 2018–2020, was estimated by the base run to be $F/F_{\mathrm{MSY}} = 0.77$ (Table 22). The fishery status was also robust (Figures 38 - 40). Of the MCBE runs, approximately 90% agreed with the base run that the stock is not currently experiencing overfishing.

Compared to SEDAR 28, the qualitative results of stock and fishery status are similar (Figure 41).

4.11 Sensitivities and Retrospective Runs

Sensitivity runs, described in §3.21, were used for exploring data or model issues that arose during the assessment process, for evaluating implications of assumptions in the base assessment model, and for interpreting MCBE results in terms of expected effects of input parameters. In some cases, sensitivity runs are simply a tool for better understanding model behavior, and therefore all runs are not considered equally plausible in the sense of alternative states of nature. Time series of F/F_{MSY} and $\mathrm{SSB}/\mathrm{SSB}_{\mathrm{MSY}}$ are plotted to demonstrate sensitivity to the changing conditions in each run. This operational assessment explored sensitivity of the base run to changes in data input, natural mortality, steepness, and general recreational discard mortality (Figures 42–45). Of these modifications, results were most sensitive to the scale of natural mortality and steepness.

Retrospective analyses suggest no concerning patterns of estimating F or SSB in the terminal year (Figure 46) or status indicators (Figure 47). Terminal-year recruitment was variable across retrospective peels.

4.12 Projections

Since the stock status is not overfished or undergoing overfishing, three projections are provided for completeness and were recommended by the SEDAR 78 panel.

Projection scenario 1, which assumed L_{current}(average landings over the last 3 years) during the interim period (2021-2022) and $F = F_{\text{current}}$ for following years, predicted the stock to decrease until management measure take place and then increase back to SSB_{MSY} (Figure 48, Table 24).

Projection scenario 2, which assumed L_{current}(average landings over the last 3 years) during the interim period (2021-2022) and $F = Fmsy$ for following years, predicted the stock to decrease until management measure take place and then increase but not recover to SSB_{MSY} in the terminal year (Figure 49, Table 25).

Projection scenario 3, which assumed L_{current}(average landings over the last 3 years) during the interim period (2021-2022) and $F = 75\%Fmsy$, predicted the stock to decrease until management measure take place and then increase back to SSB_{MSY} (Figure 50, Table 26).

4.13 Discussion

The base run of the BAM indicated that the stock is not overfished SSB/MSST =1.4, and that overfishing is not occuring based on the 3–year geometric mean F/F_{MSY} =0.77. The 2020 point estimate for F/F_{MSY} indicated overfishing primarily due to a large increase in the general recreational landings during the COVID-19 pandemic. Should this high rate of fishing continue after 2020, overfishing would likely ensure. Indeed, preliminary MRIP estimates of Spanish mackerel landings in 2021 were higher than in 2020. The stock continues to show resilience to fishing effort as in SEDAR 28 (Figure 41). Neither of these models show a stock that was overfished or near overfishing in 2007 as SEDAR17 (2008) indicated.

The Monte Carlo/bootstrap ensemble analyses showed widespread agreement with the qualitative results of the base run. Of all MCBE runs, 92.6% showed that the stock is not overfished, and 90.0% showed that overfishing is not occurring.

4.13.1 Comments on the Assessment

In addition to including the more recent years of data, this operational assessment contained several modifications to the previous data of SEDAR 28, such as the use of modern MRIP methodology, the use of the Dirichlet–multinomial distribution to fit age compositions, pooling age compositions across years for fleets with low annual sample sizes, modification to selectivity functions applied to landings, update of the growth models and natural mortality, removing sex–specific growth and selectivity, and changing the start year of the model. The assessment model itself was also modernized to the current version of BAM. The sum of these improvements should result in a more robust assessment.

There is a lack of available fishery independent indices of abundance for this species. The schooling behavior of Spanish mackerel makes a random survey of their population particularly difficult. The one fishery independent index used (SEAMAP YOY) was highly variable, as would be expected for a recruitment index.

In general, fishery dependent indices of abundance may not track actual abundance well, because of factors such as hyperdepletion or hyperstability. Furthermore, this issue can be exacerbated by management measures. In this assessment, the commercial handline index was generated from Florida trip ticket data. There was a shift in the commercial handline index in 2004 after which a run of positive residuals persisted in the model fit. A sensitivity run excluding the commercial handline index did not influence the results in the terminal year of the assessment. The

index was included in the model but should be investigated further in future assessments. In general, management measures in the southeast U.S. have made the continued utility of fishery dependent indices questionable. This situation amplifies the importance of fishery independent sampling.

Natural mortality plays a driving role in this assessment, as it does in most. The pattern of natural mortality at age affects multiple outputs, including annual fishing rates, benchmarks, and equilibrium age structure expected at MSY. The model could estimate steepness at 0.73 but it was only weakly informed above 0.60 and would stay close to the starting value. As in SEDAR 28, steepness was fixed at 0.75 as a mid-point of the range over which no likelihood signal was available.

4.14 Comments on the Projections

As usual, projections should be interpreted in light of the model assumptions and key aspects of the data. Some major considerations are the following:

- In general, projections of fish stocks are highly uncertain, particularly in the long term (e.g., beyond 5–10 years).
- Although projections included many major sources of uncertainty, they did not include structural (model) uncertainty. That is, projection results are conditional on one set of functional forms used to describe population dynamics, selectivity, recruitment, etc.
- Fisheries were assumed to continue fishing at their estimated current proportions of total effort, using the estimated current selectivity patterns. New management regulations that alter those proportions or selectivities would likely affect projection results.
- The projections assumed that the estimated spawner-recruit relationship applies in the future and that past residuals represent future uncertainty in recruitment. If future recruitment is characterized by runs of large or small year classes, possibly due to environmental or ecological conditions, stock trajectories may be affected.

4.15 Research Recommendations

The research recommendations from the SEDAR 78 panel were as follows:

- Development of a fishery-independent survey for pelagic species would decrease reliance on a fishery-dependent index of abundance that has unexplained trends in residual values in recent years.
- Examine how schooling or migratory dynamics may influence the catchability of the species. In particular, research the assumption of the hyperstability of indices that sample the schooling portion of the stock.
- Age-dependent natural mortality was estimated by indirect methods (Lorenzen) for this assessment. Telemetry- and conventional-tagging programs can provide alternative estimates of natural mortality. Investigate new methods for determining point estimates for natural mortality.

4.16 Sampling Recommendations

- Limited information is available for shrimp bycatch in the Atlantic. Comprehensive observer coverage across space and time are needed to adequately capture the scale and size distribution of bycatch for Spanish mackerel and other species.
- The general recreational discards have increased dramatically in the last 2 years of this assessment. A better understanding of the size composition and mortality of discarded fish would improve the assessment, especially if discards continue to increase due to effort or future management changes.
- Implement systematic age sampling for the general recreational and commercial sectors. Age samples were important for this assessment for determining key parameters but sample sizes were limited, particularly for the general recreational sector, commercial handline and commercial cast net sectors, which account for the majority of the recent landings.

Table 11. Estimated time series and status indicators. Fishing mortality rate is full F, which includes discard mortalities. Total biomass (B, mt) is at the start of the year, and spawning biomass (SSB, mt) at the end of July (time of peak spawning). The MSST *is defined by* $\text{MSST} = 75\%\text{SSB}_{\text{MSY}}$. *SPR is static spawning potential ratio.*

Table 12. Selectivity at age (end-of-assessment time period) for commercial handline (cH), commercial pound net (cP), commercial gill net (cG), commercial cast net (cC), and general recreational (GR) landings. Selectivity at age for general recreational discards (GR.D), shrimp bycatch discards (SB.D), and selectivity of landings averaged across fisheries (L.avg), discards averaged across fisheries (D.avg) and catches across fisheries (tot.avg).

Age	FL(mm)	cH	cP	cG	cC	GR	GR.D	SB.D	L.avg	D.avg	tot.avg

Table 13. Estimated time series of fully selected fishing mortality rates for commercial handline (F.cH), commercial pound net (F.cP), commercial gill net (F.cG), commercial cast net (F.cC), general recreational (F.GR), general recreational discards(F.GR.D), and shrimp bycatch (F.SB.D). Also shown is apical F (Full.F), the maximum F at age summed across fleets. Full F may not equal the sum of fully selected F's because of dome-shaped selectivities.

Table 22. Estimated status indicators, benchmarks, and related quantities from the base run of the Beaufort catch-age model, conditional on estimated current selectivities averaged across fleets. Also presented are median values and measures of precision (standard errors, SE) from the Monte Carlo/Bootstrap ensemble (MCBE) analysis. Rate estimates (F) are in units of y^{-1}; status indicators are dimensionless; and biomass estimates are in units of metric tons or pounds, as indicated. Spawning stock biomass (SSB) is measured as total mature female biomass. The definitions of MSST in this assessment is $MSST = 75\%SSBMSY$.

Quantity	Units	Estimate	Median	SE
F_{MSY}	y^{-1}	0.516	0.523	0.111
$75\%F_{\text{MSY}}$	y^{-1}	0.387	0.392	0.083
$F_{30\%}$	y^{-1}	0.608	0.615	0.059
$F_{40\%}$	y^{-1}	0.410	0.414	0.038
B_{MSY}	metric tons	19588	19821	2232
SSB_{MSY}	metric tons	6406	6410	1122

4.19 Figures

Figure 1. Mean length at age (mm) of the population (purple, solid), females (green, dashed) and the fished population (yellow, dotted).

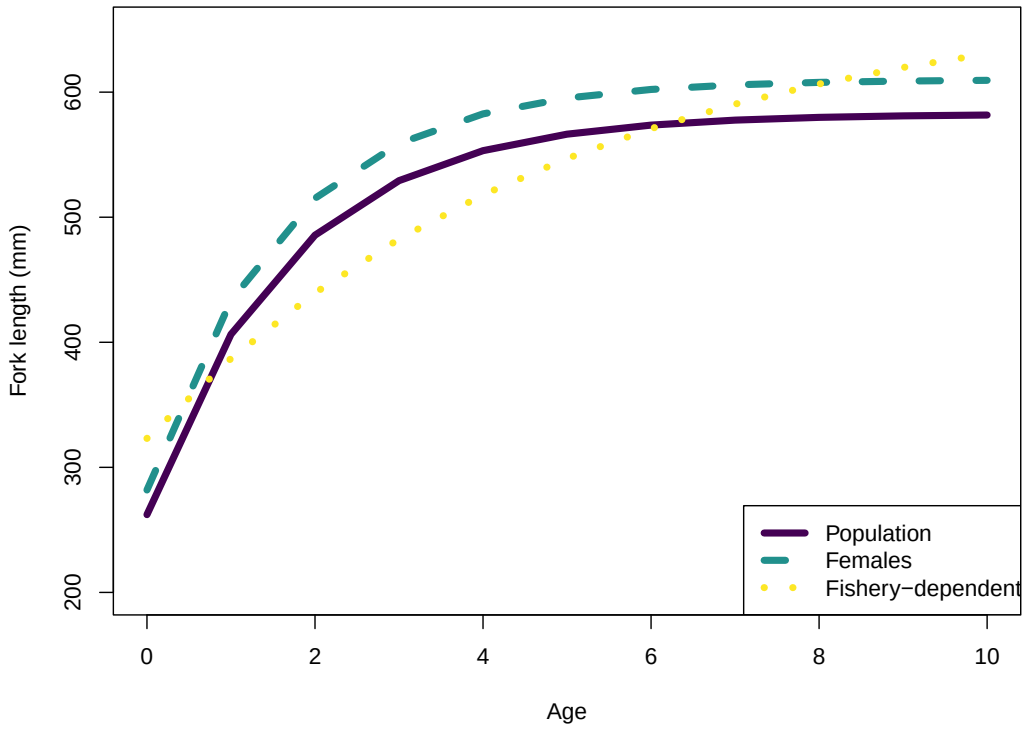

Figure 2. Observed (open circles) and estimated (solid line) annual age compositions by fleet. In panel definition of series; acomp refers to age compositions, cH to commercial handline, cP to pound nets, cG to gill nets, cC to cast nets, and GR to recreationl.

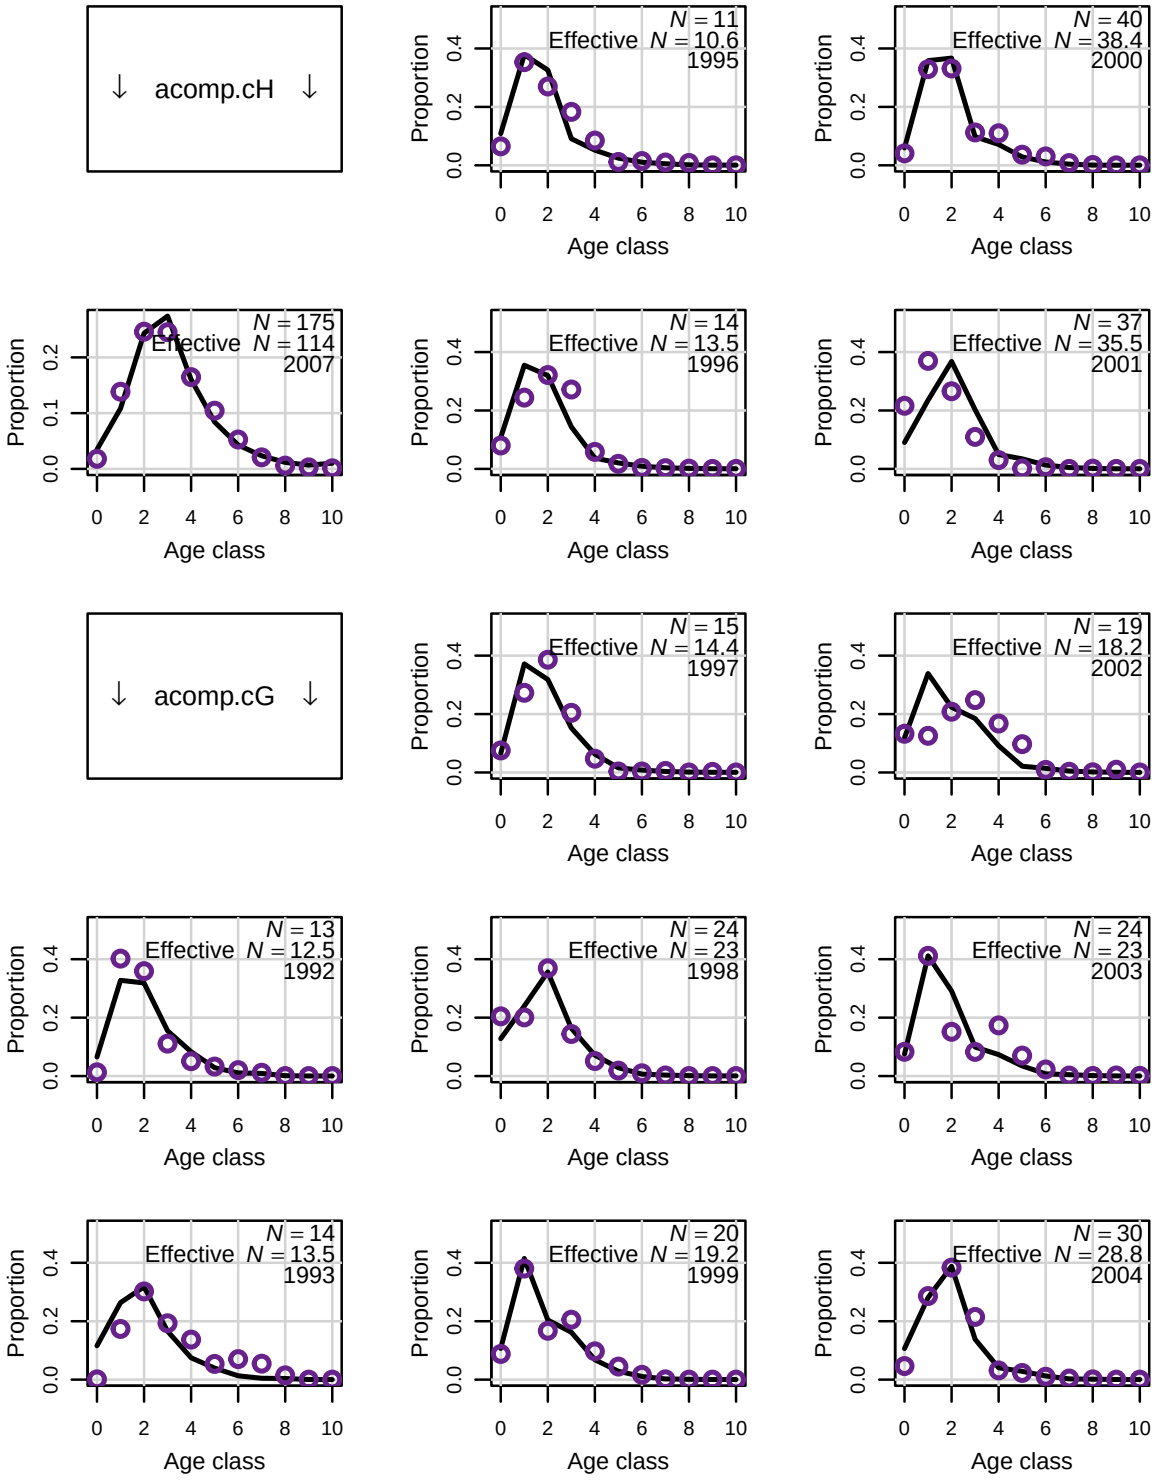

Figure 2. (cont.) Observed (open circles) and estimated (solid line) annual age compositions by fleet.

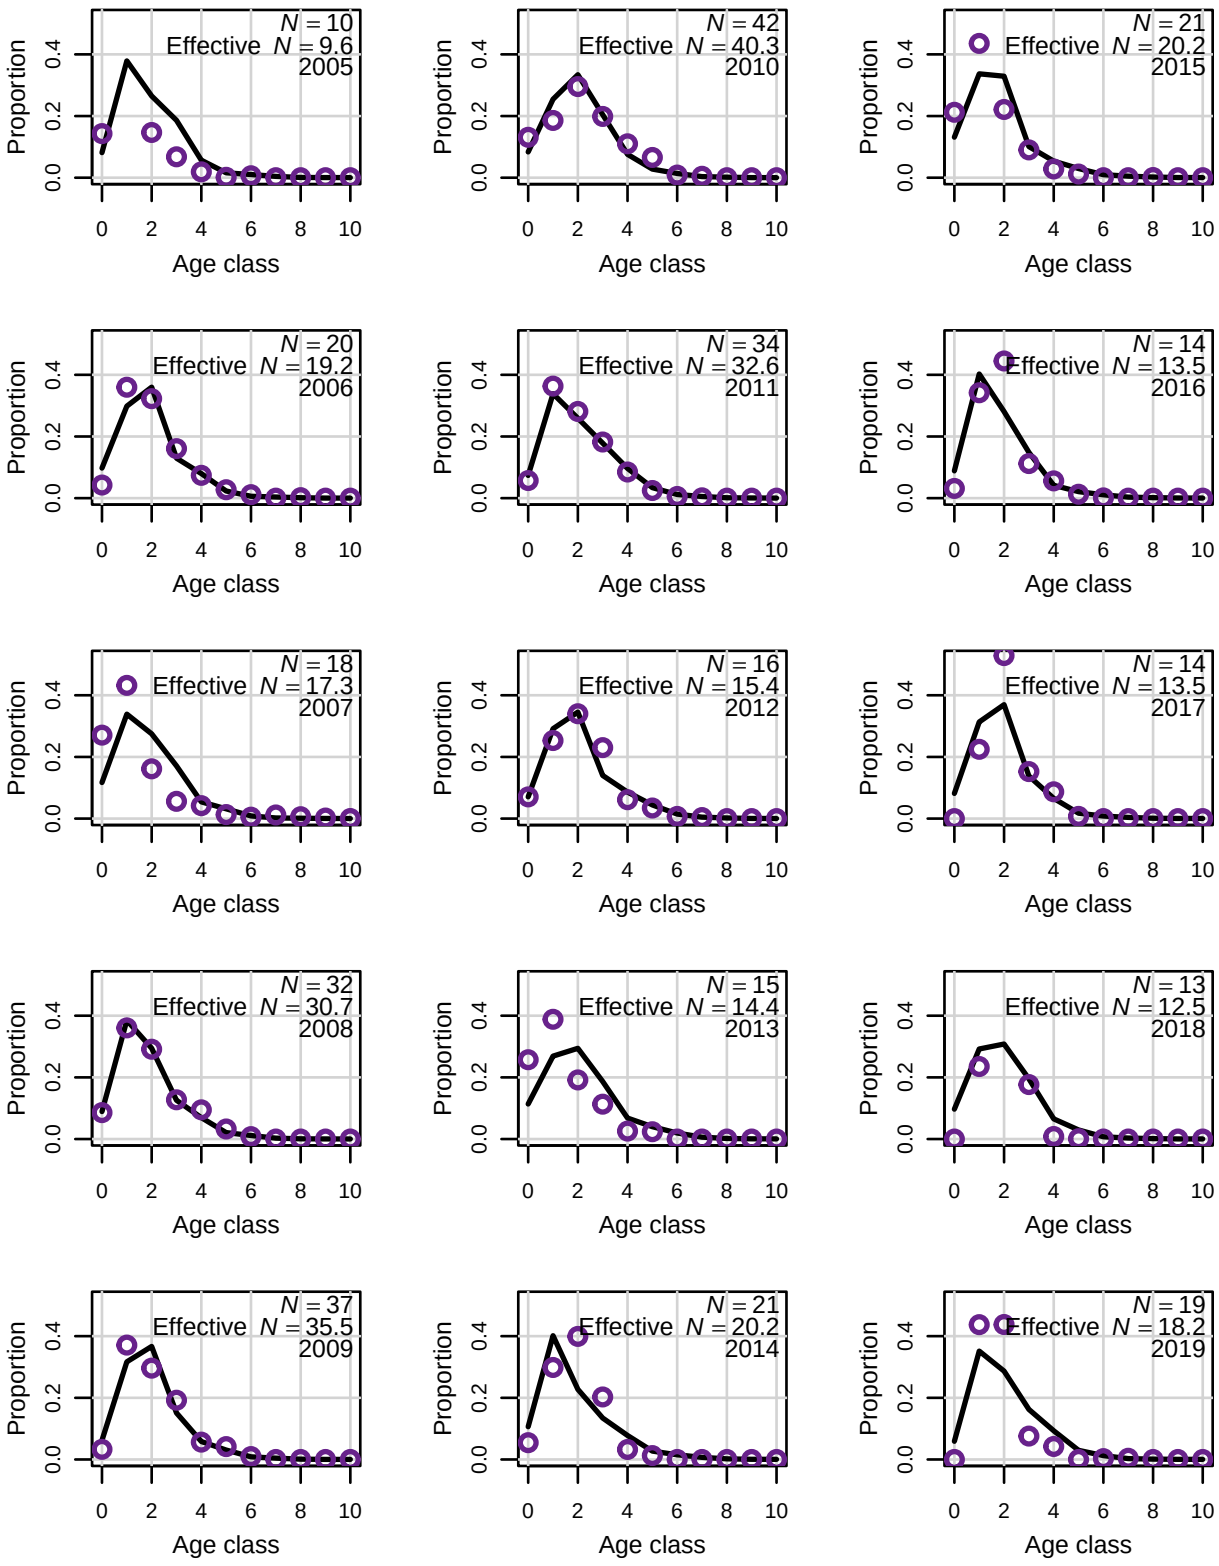

Figure 2. (cont.) Observed (open circles) and estimated (solid line) annual age compositions by fleet.

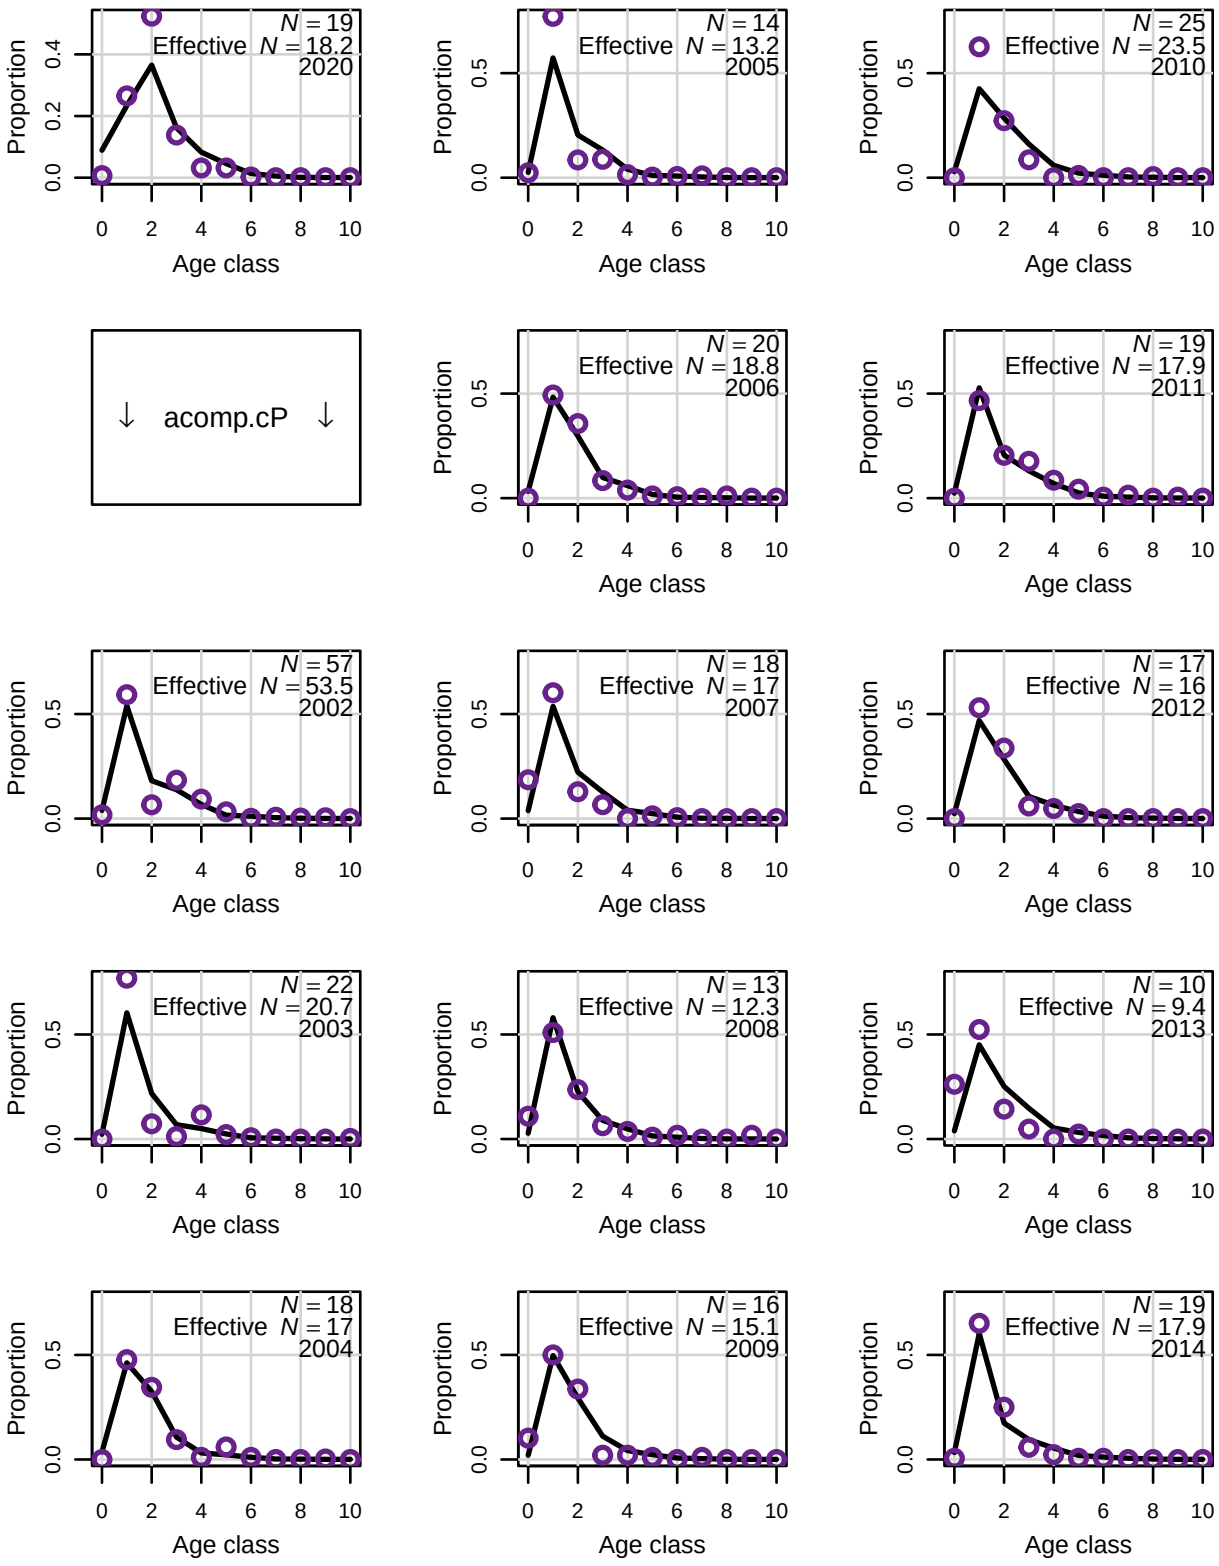

Figure 2. (cont.) Observed (open circles) and estimated (solid line) annual age compositions by fleet.

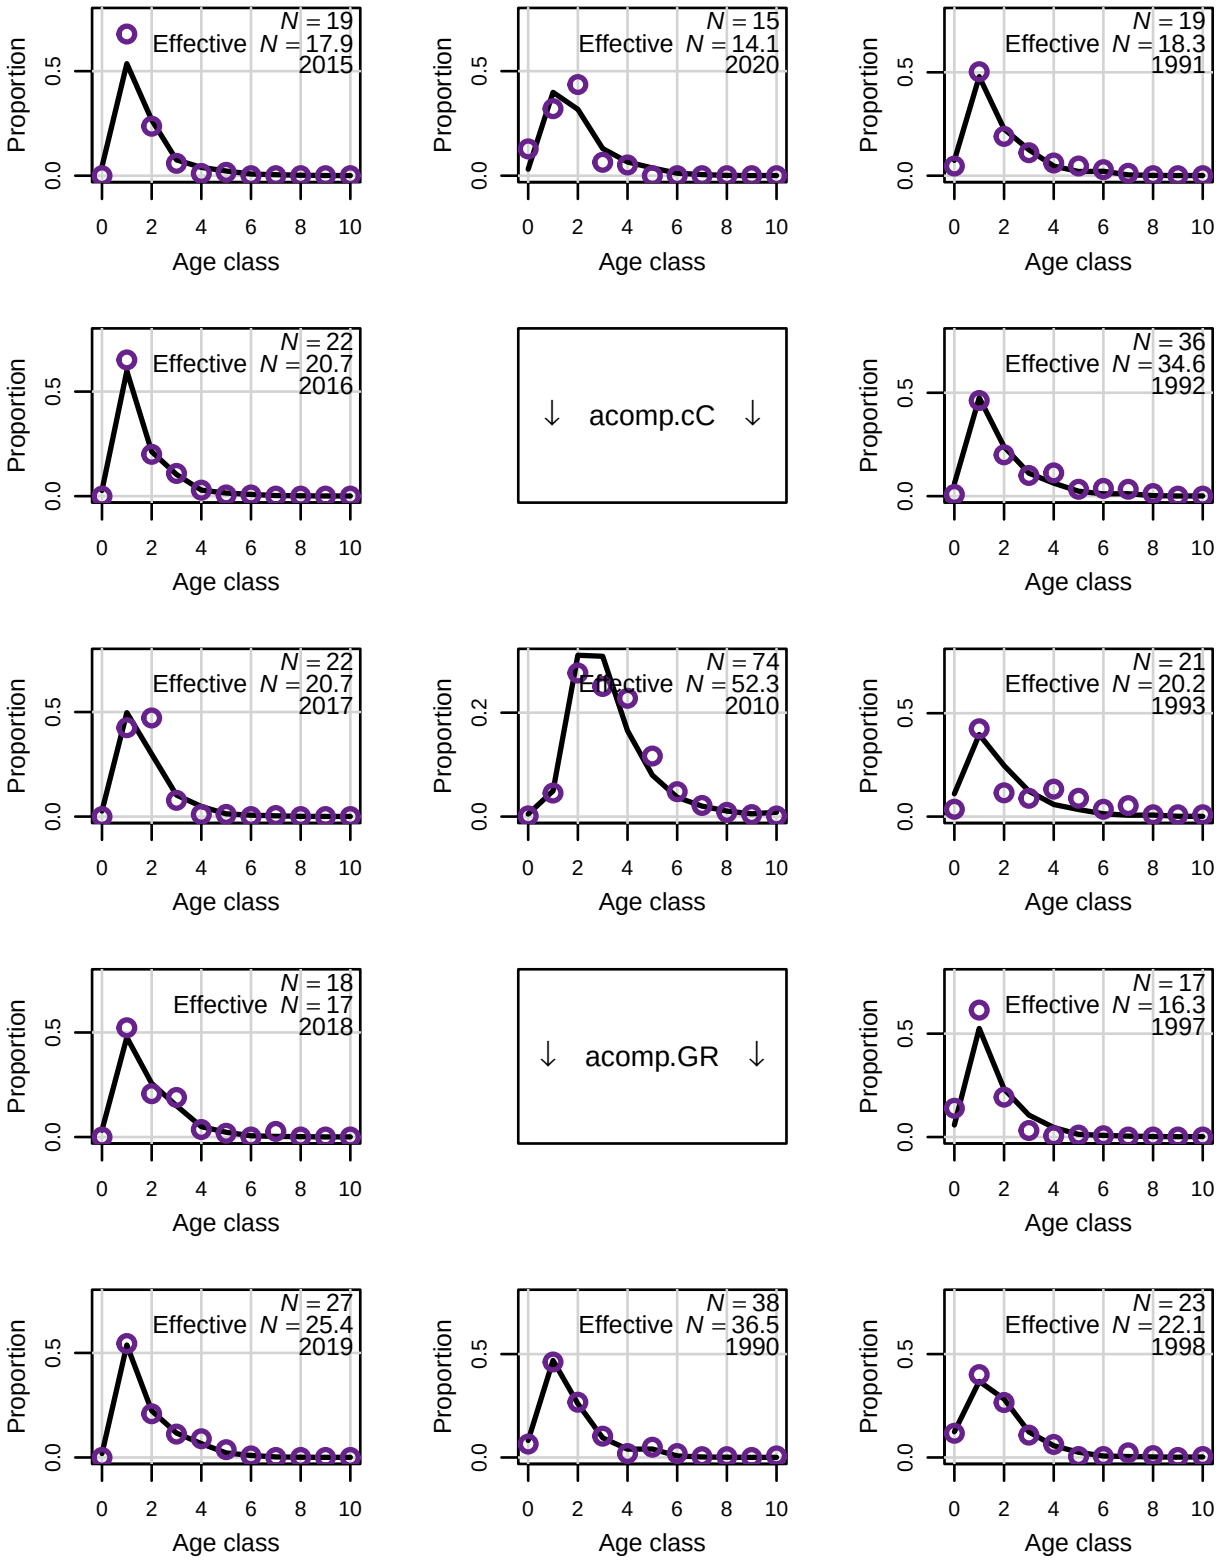

Figure 2. (cont.) Observed (open circles) and estimated (solid line) annual age compositions by fleet.

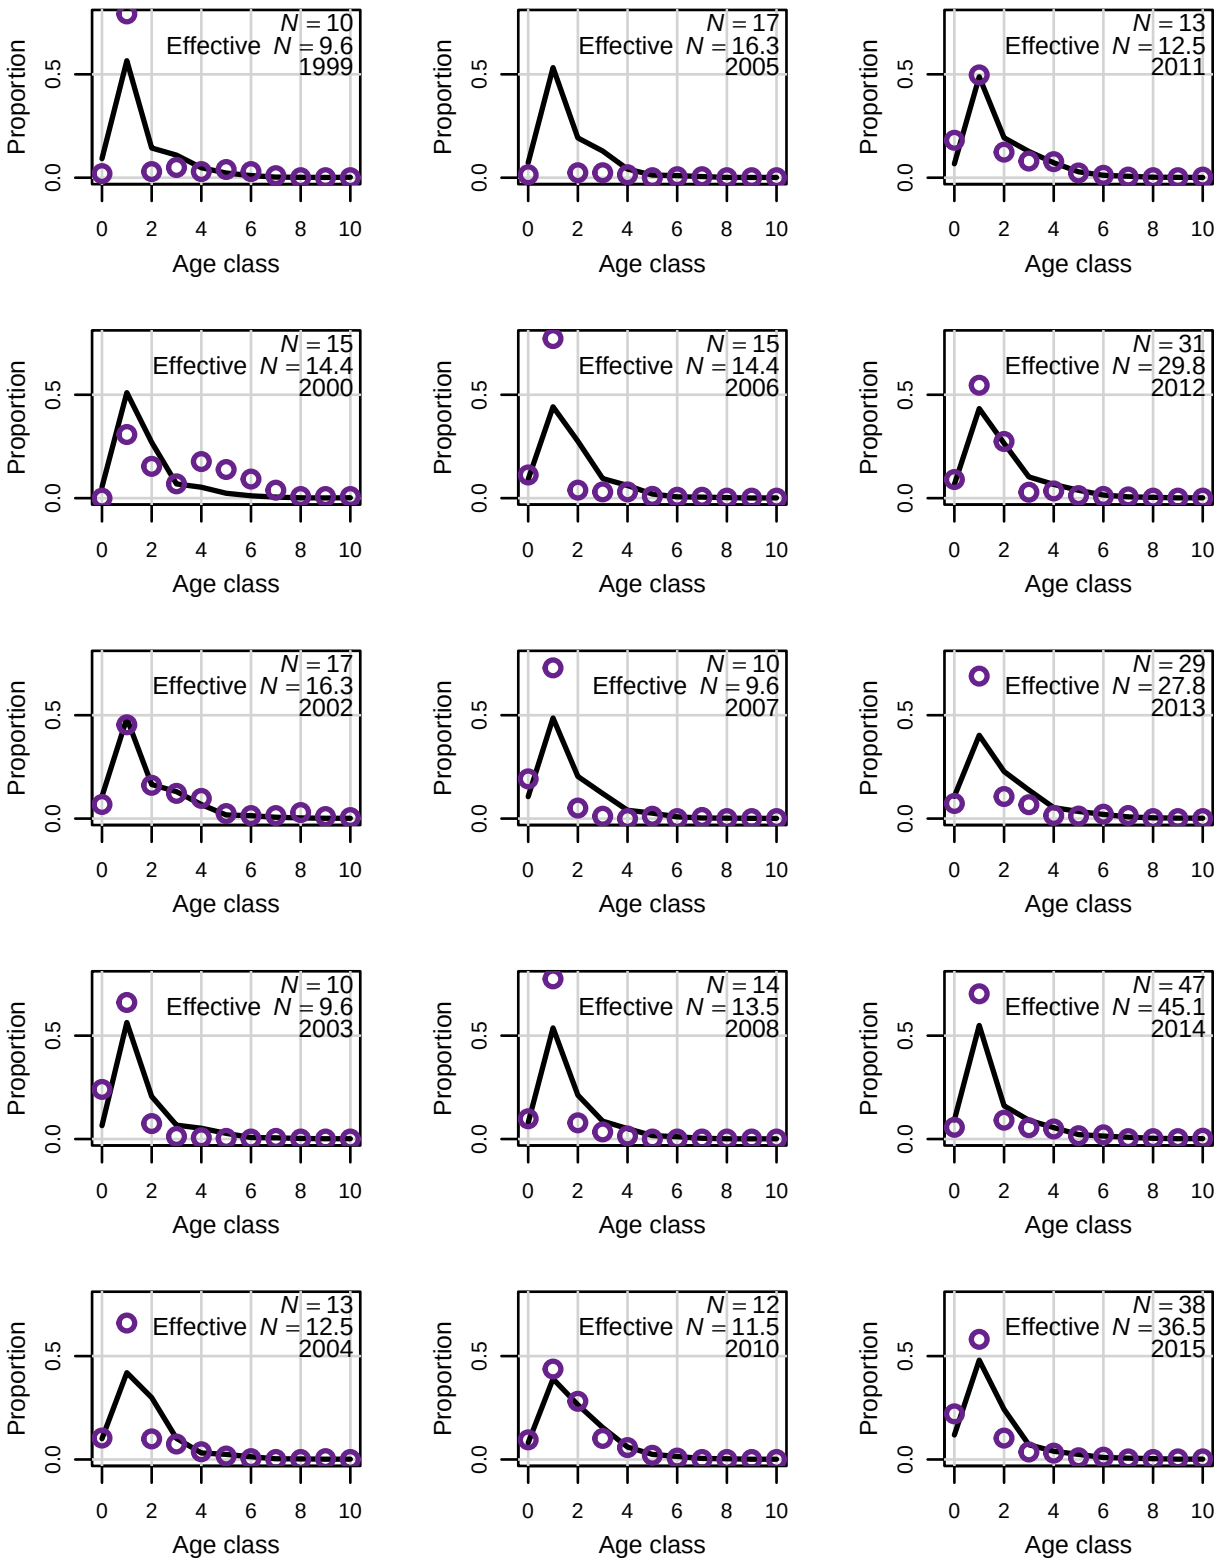

Figure 2. (cont.) Observed (open circles) and estimated (solid line) annual age compositions by fleet.

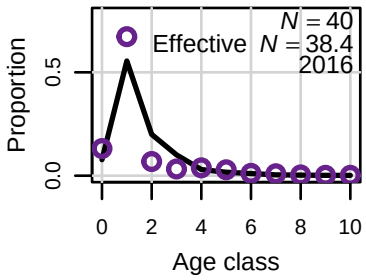

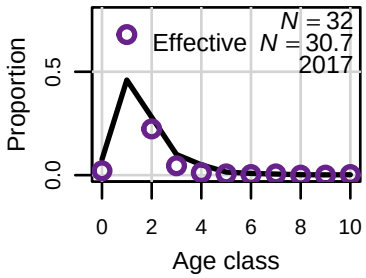

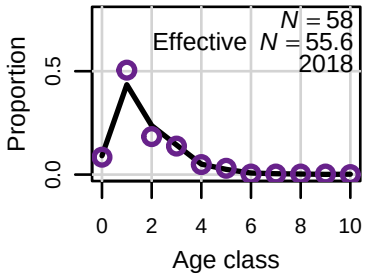

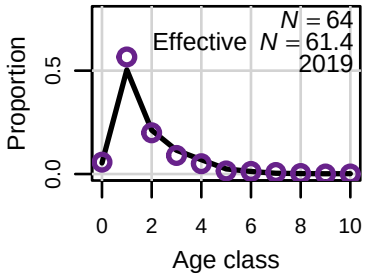

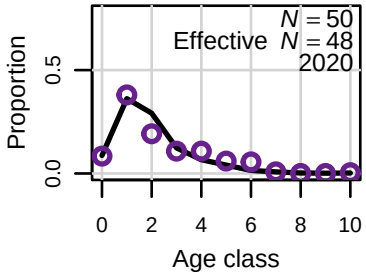

Figure 3. Top panel is a bubble plot of age composition residuals from commercial handline landings; blue represents overestimates and orange underestimates. Bottom panel shows correlation between predicted and observed values. The year is the approximate midpoint of the pooled annual compositions.

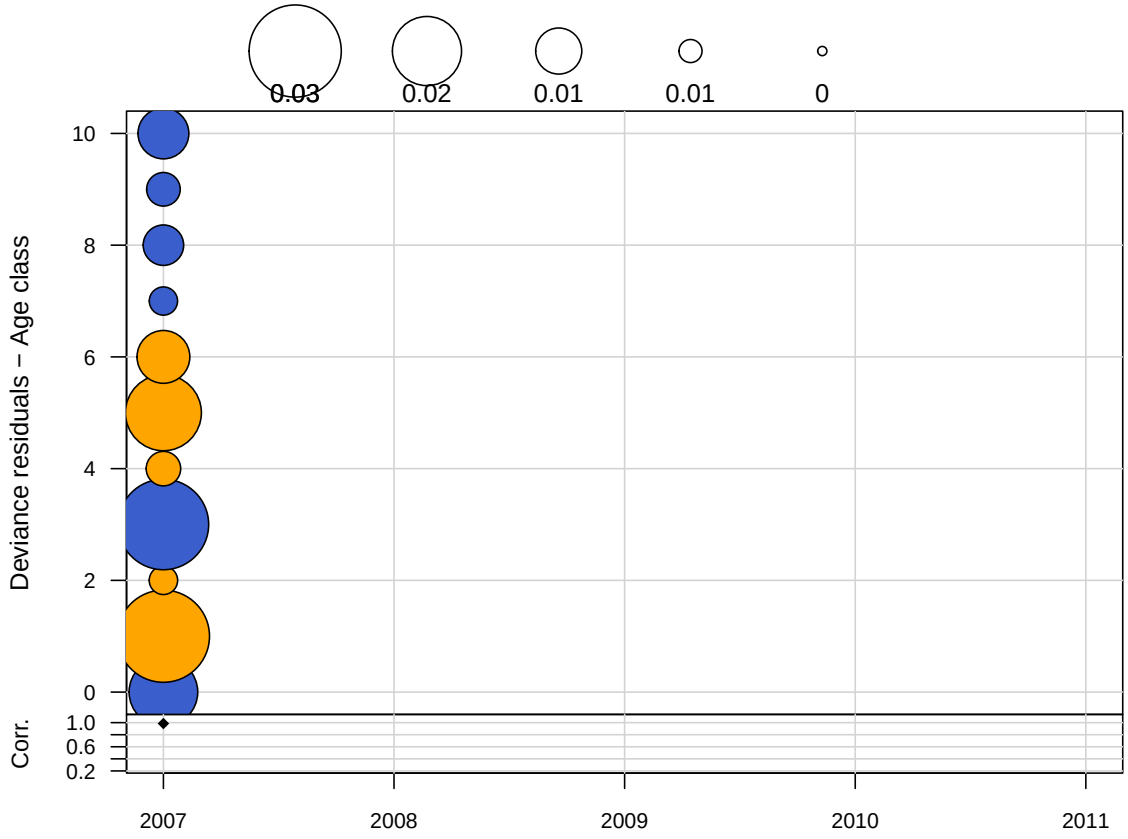

Figure 3. (cont.) Top panel is a bubble plot of age composition residuals from commercial pound net landings; blue represents overestimates and orange underestimates. Bottom panel shows correlation between predicted and observed values.

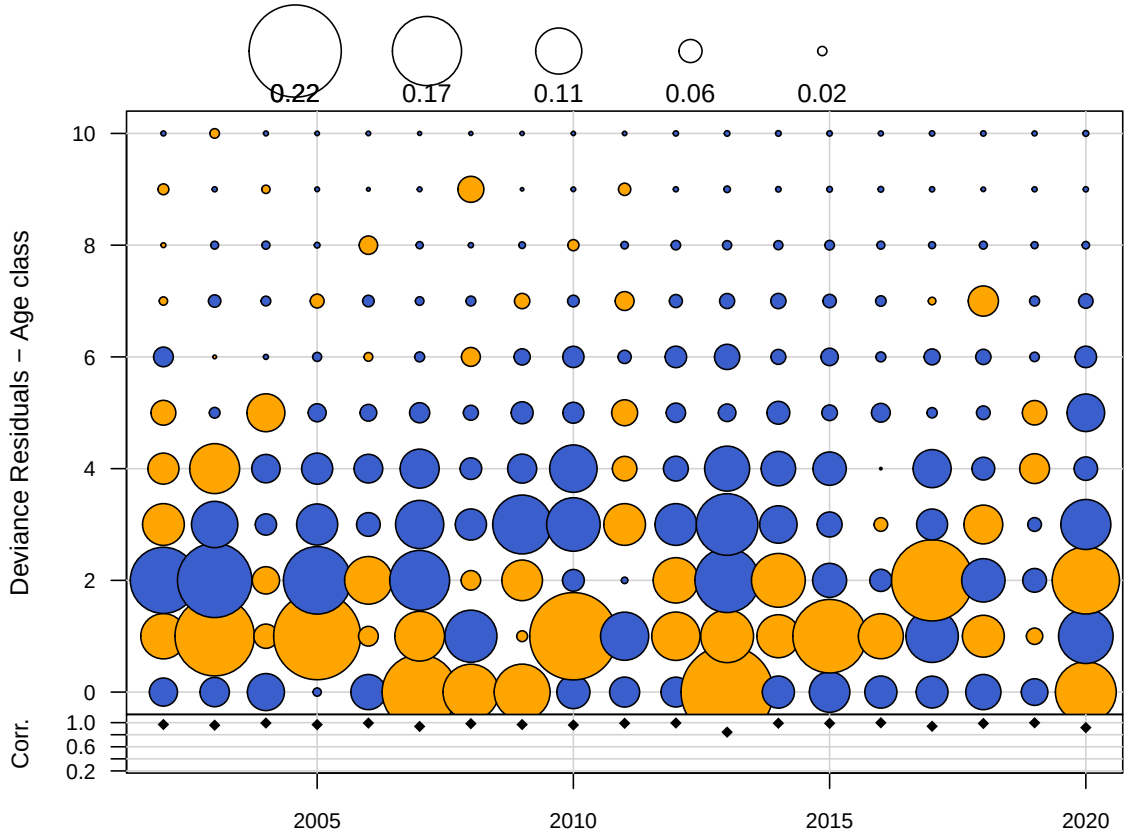

Figure 3. (cont.) Top panel is a bubble plot of age composition residuals from commercial gill net landings; blue represents overestimates and orange underestimates. Bottom panel shows correlation between predicted and observed values.

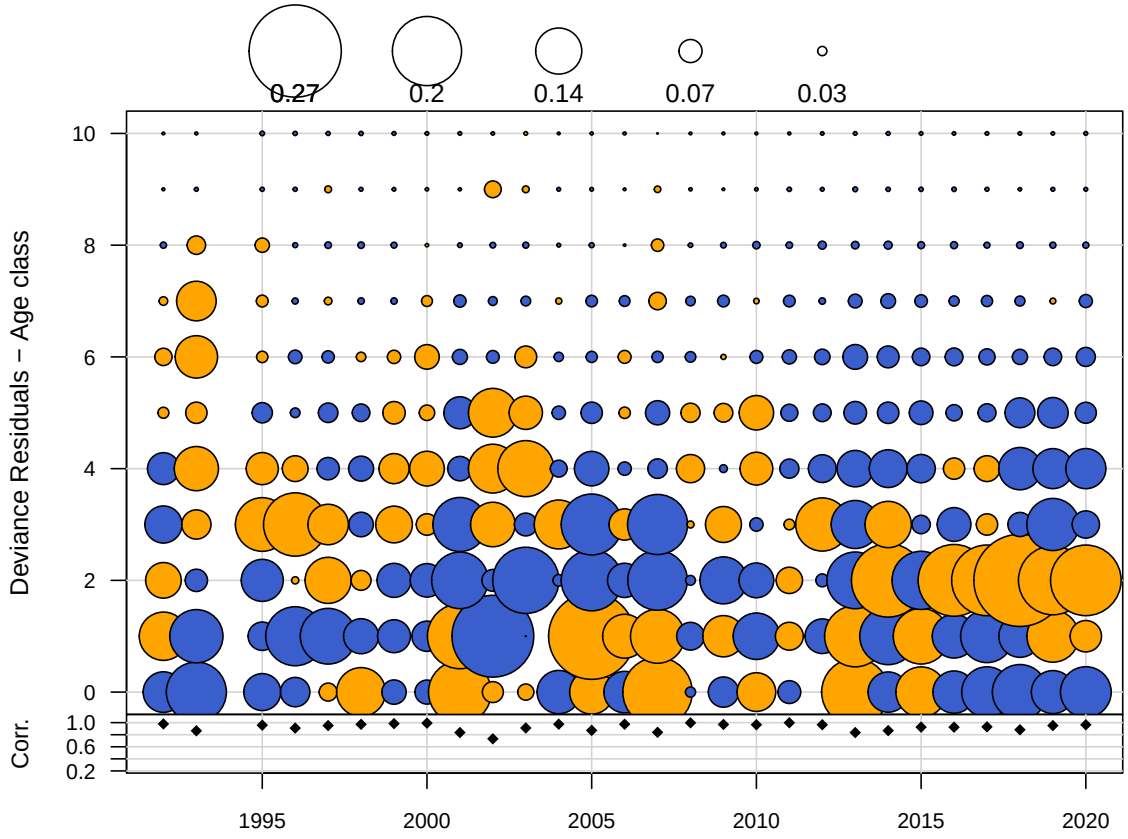

Figure 3. (cont.) Top panel is a bubble plot of age composition residuals from commercial cast net landings; blue represents overestimates and orange underestimates. Bottom panel shows correlation between predicted and observed values. The year is the approximate midpoint of the pooled annual compositions.

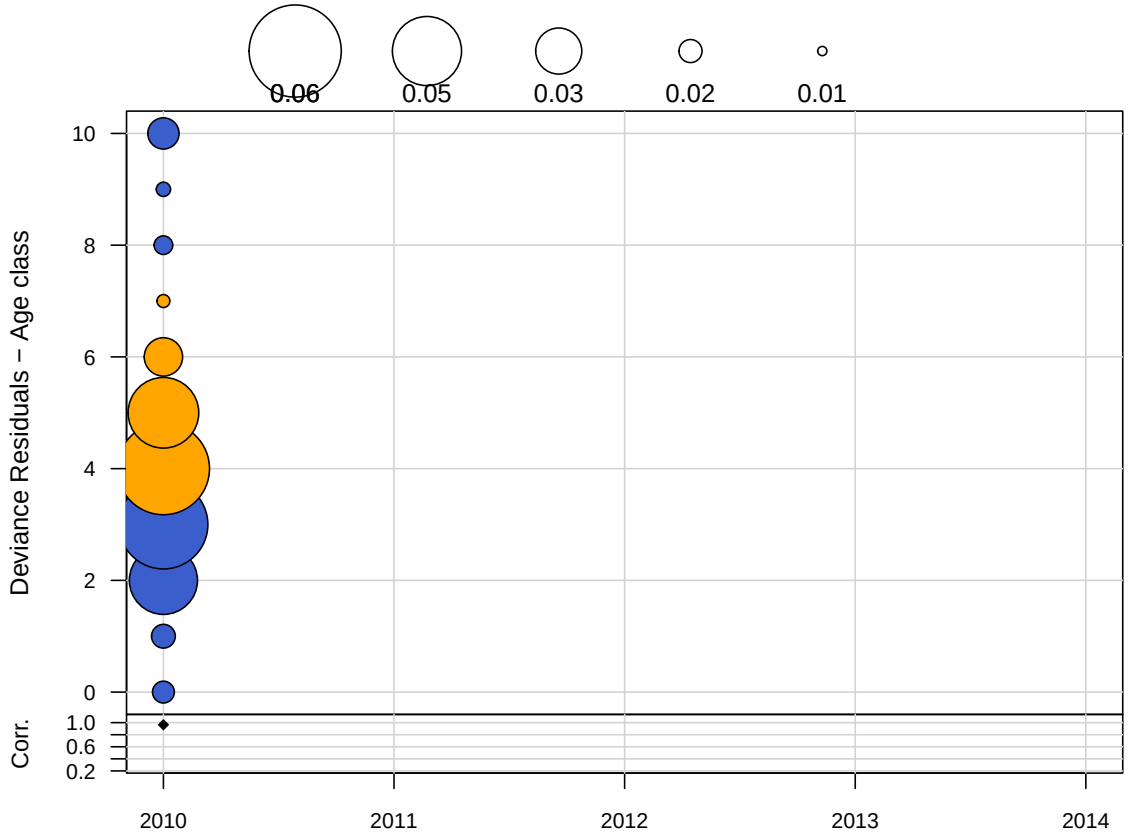

Figure 3. (cont.) Top panel is a bubble plot of age composition residuals from recreational landings; blue represents overestimates and orange underestimates. Bottom panel shows correlation between predicted and observed values.

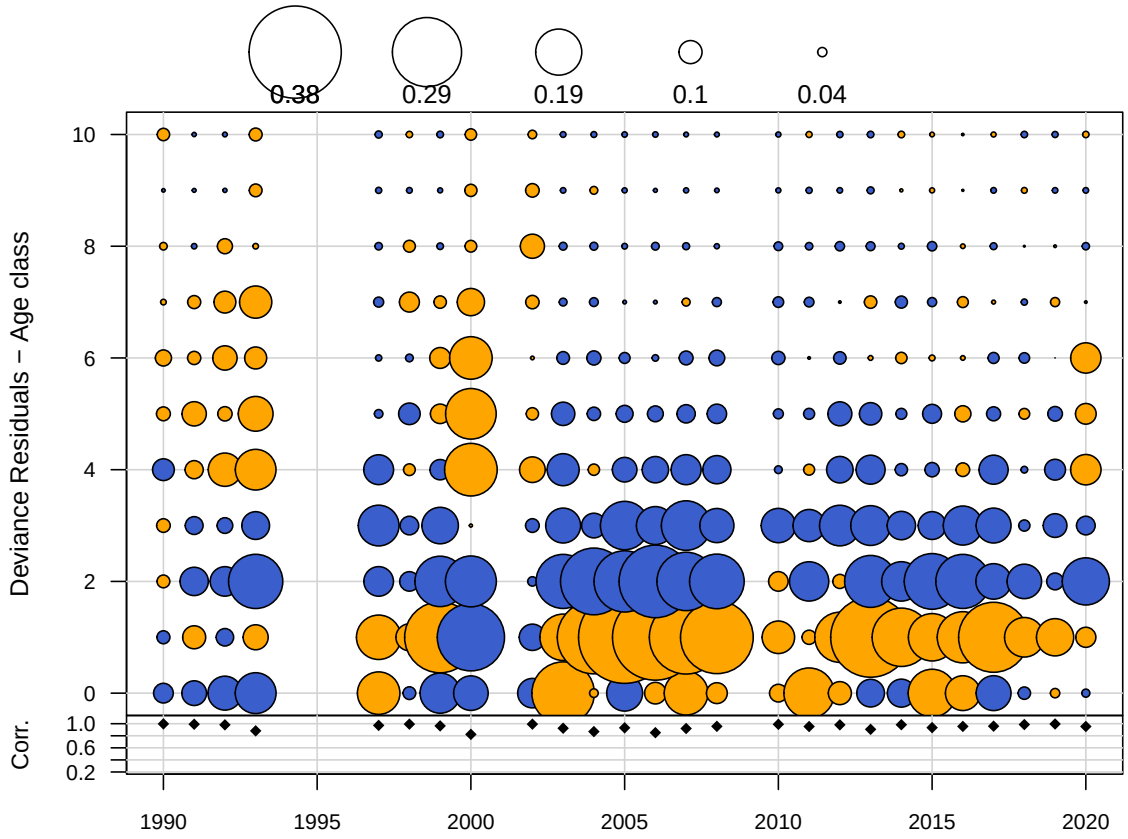

Figure 4. Observed (open circles) and estimated (line, solid circles) commercial handline landings (1000 lb whole weight).

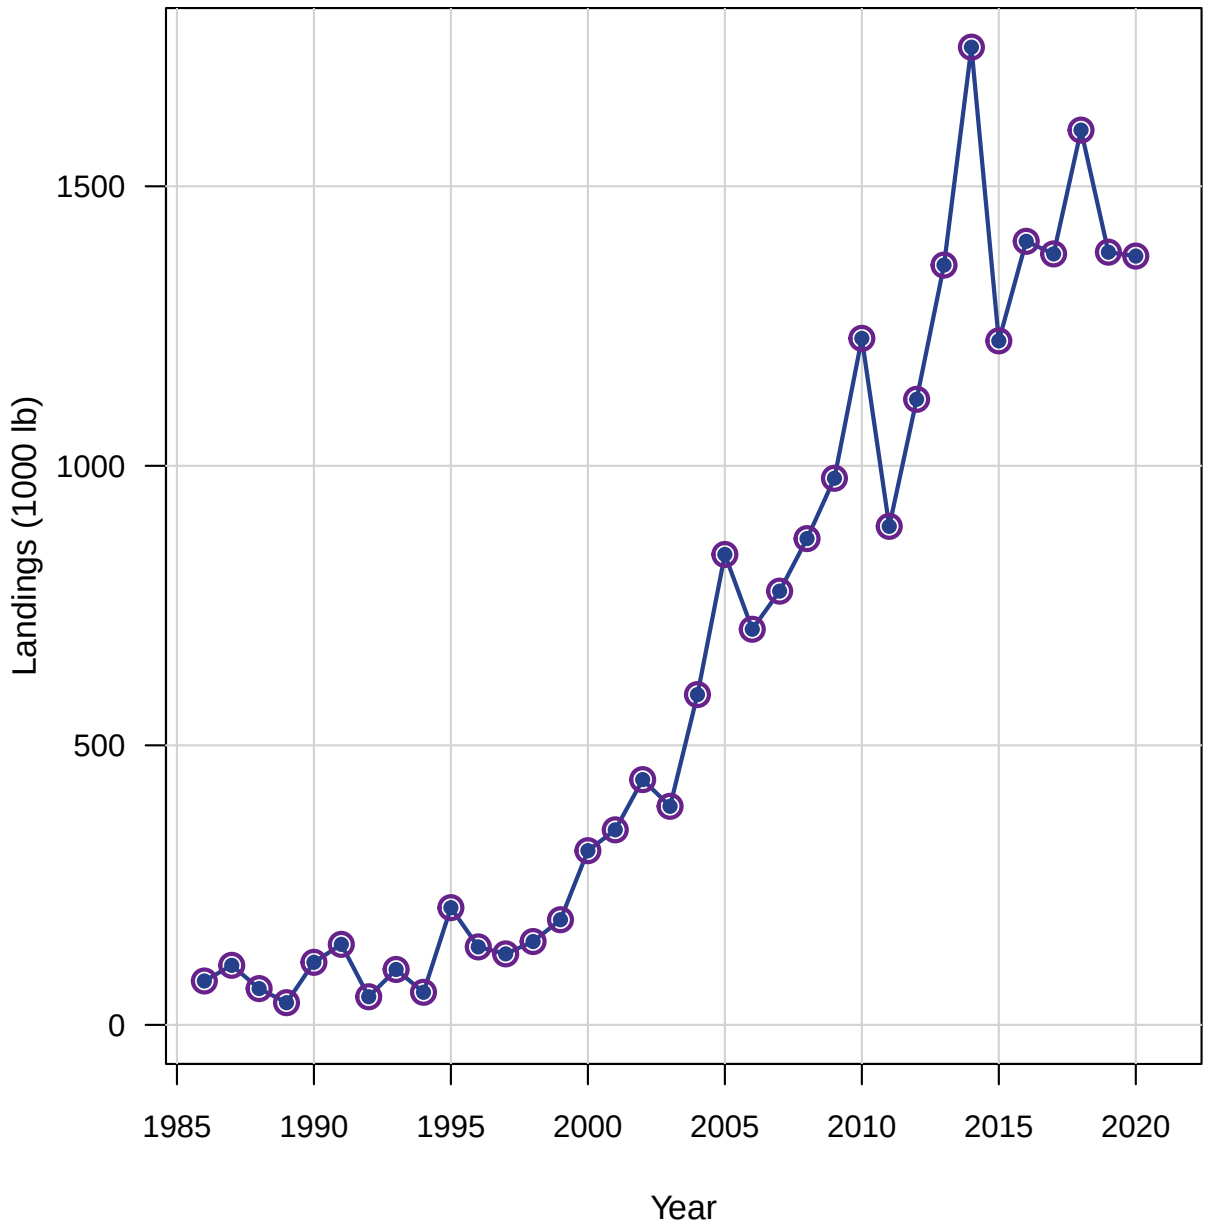

Figure 5. Observed (open circles) and estimated (line, solid circles) commercial pound net landings (1000 lb whole weight).

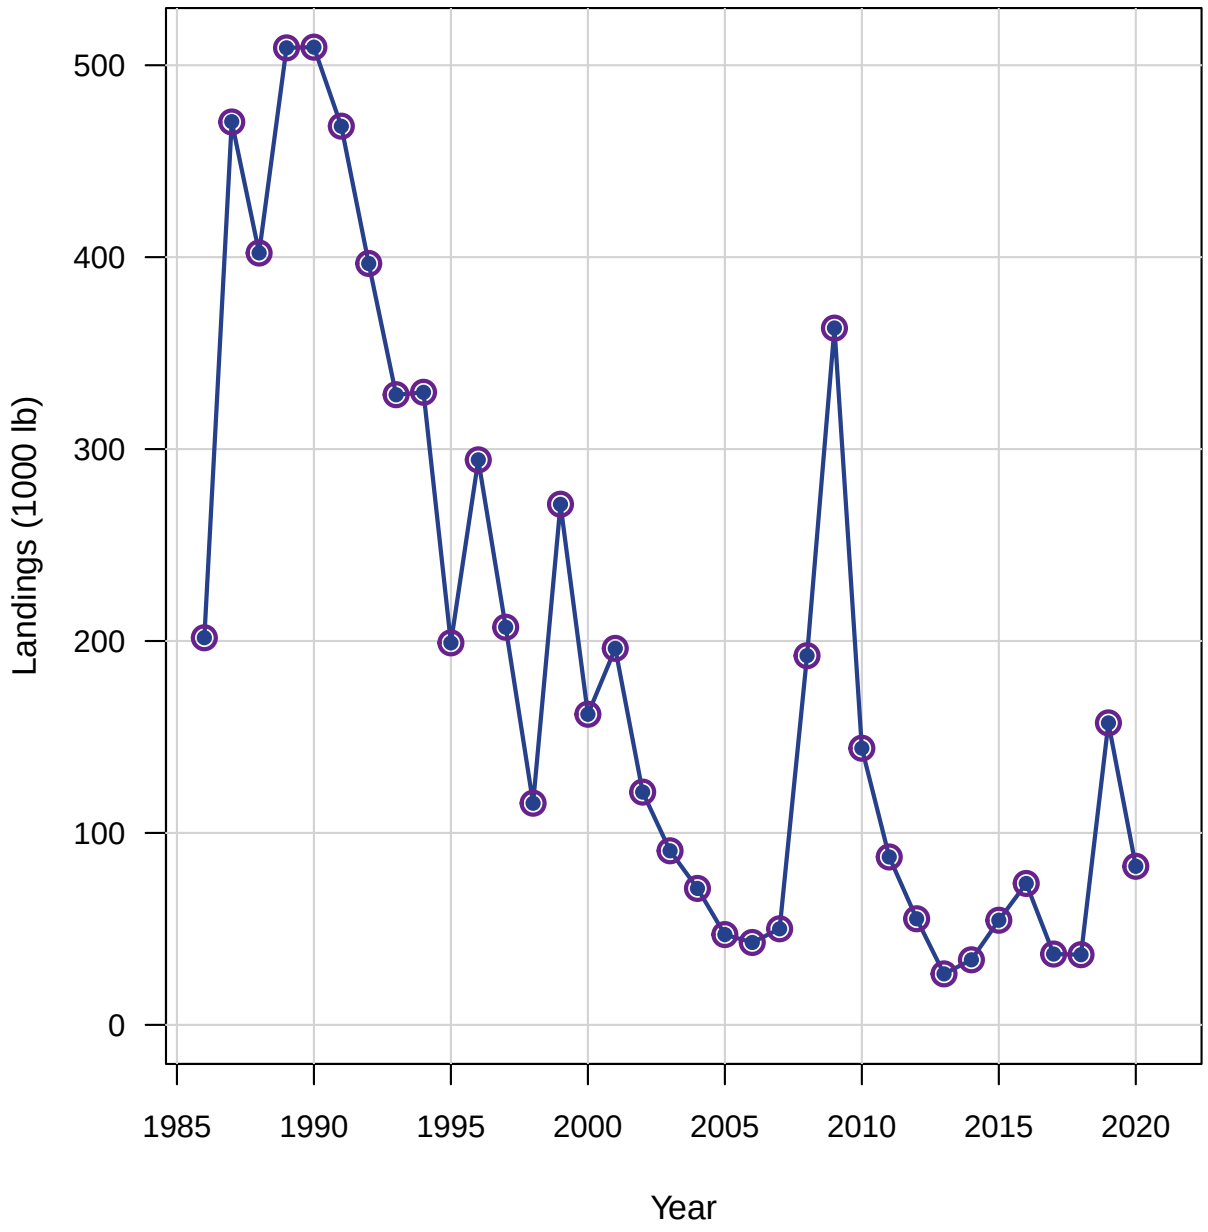

Figure 6. Observed (open circles) and estimated (line, solid circles) commercial gillnet landings (1000 lb whole weight).

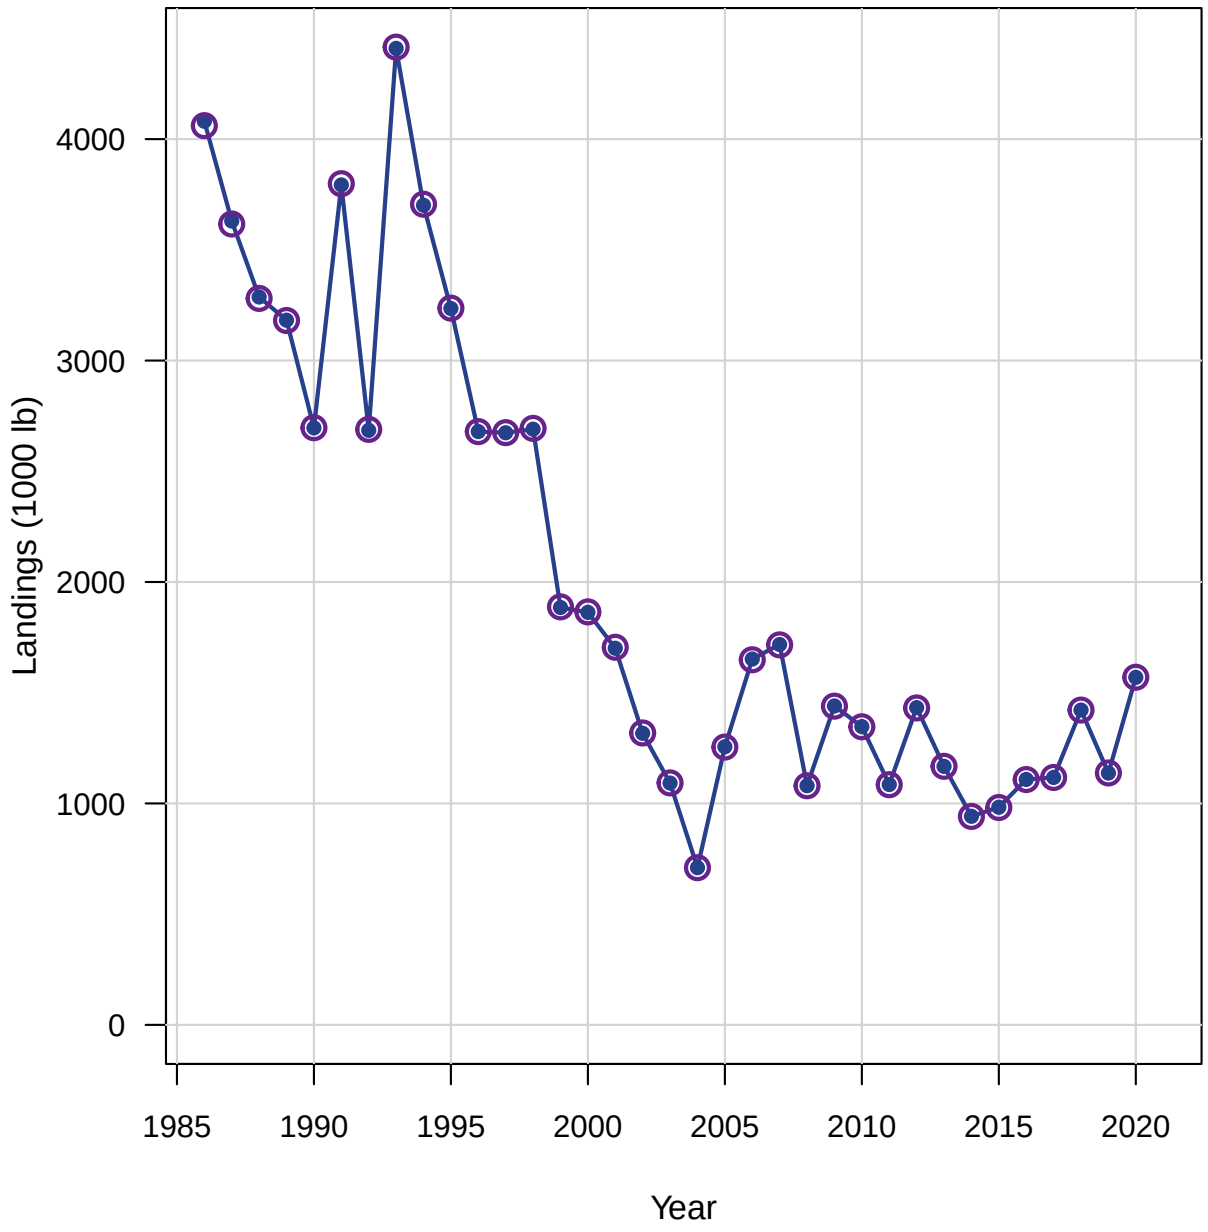

Figure 7. Observed (open circles) and estimated (line, solid circles) commercial cast net landings (1000 lb whole weight).

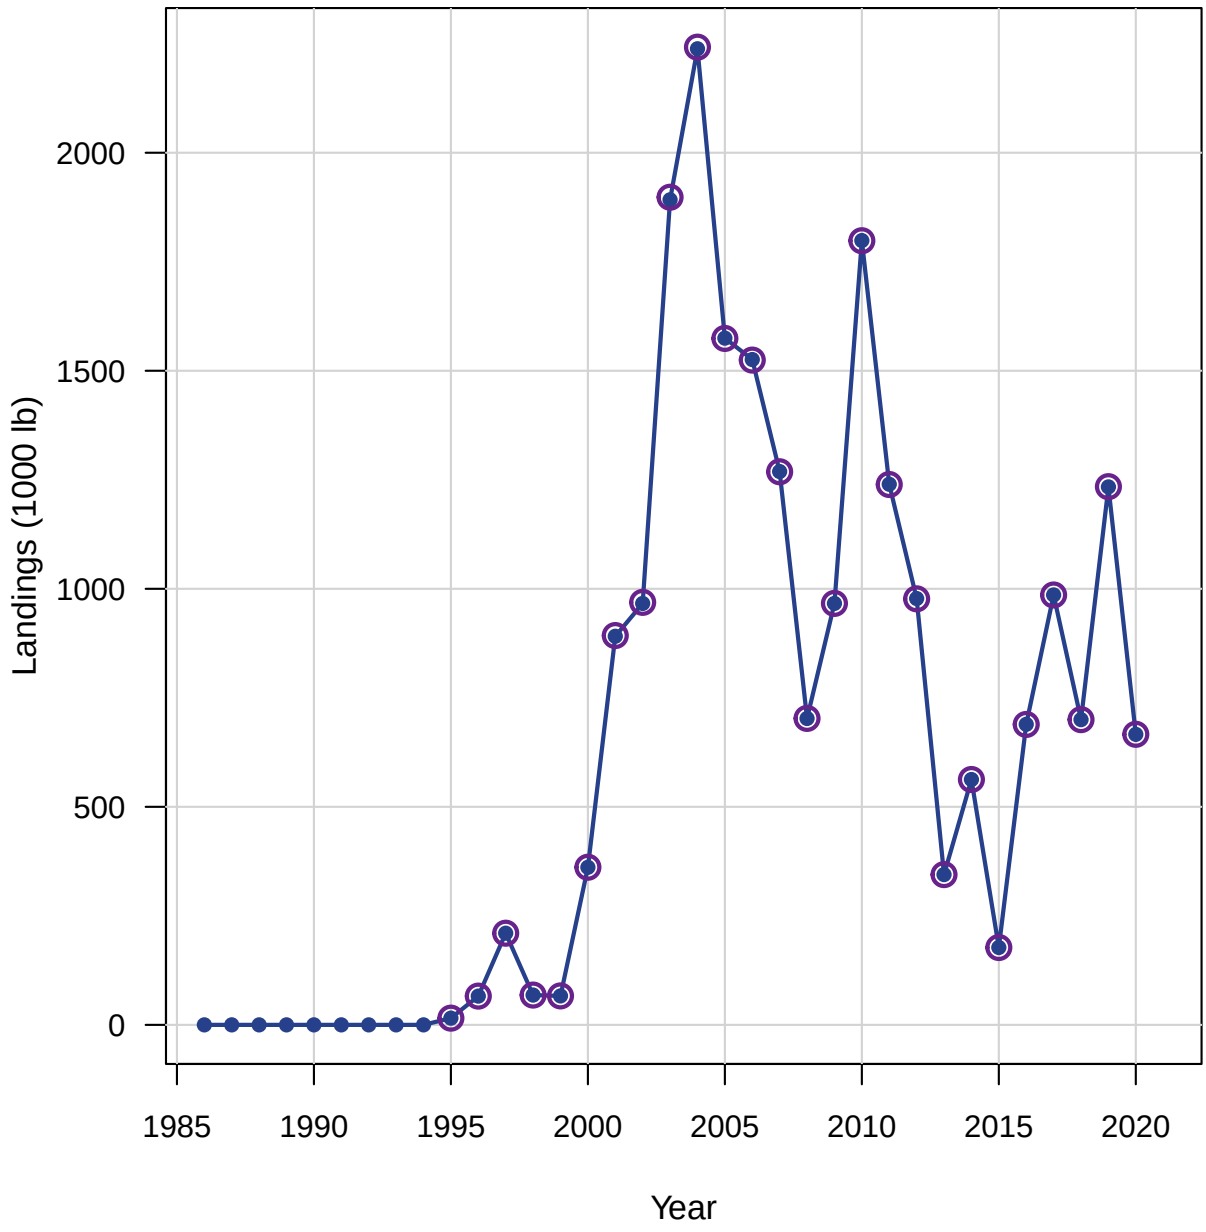

Figure 8. Observed (open circles) and estimated (line, solid circles) recreational landings (1000 fish).

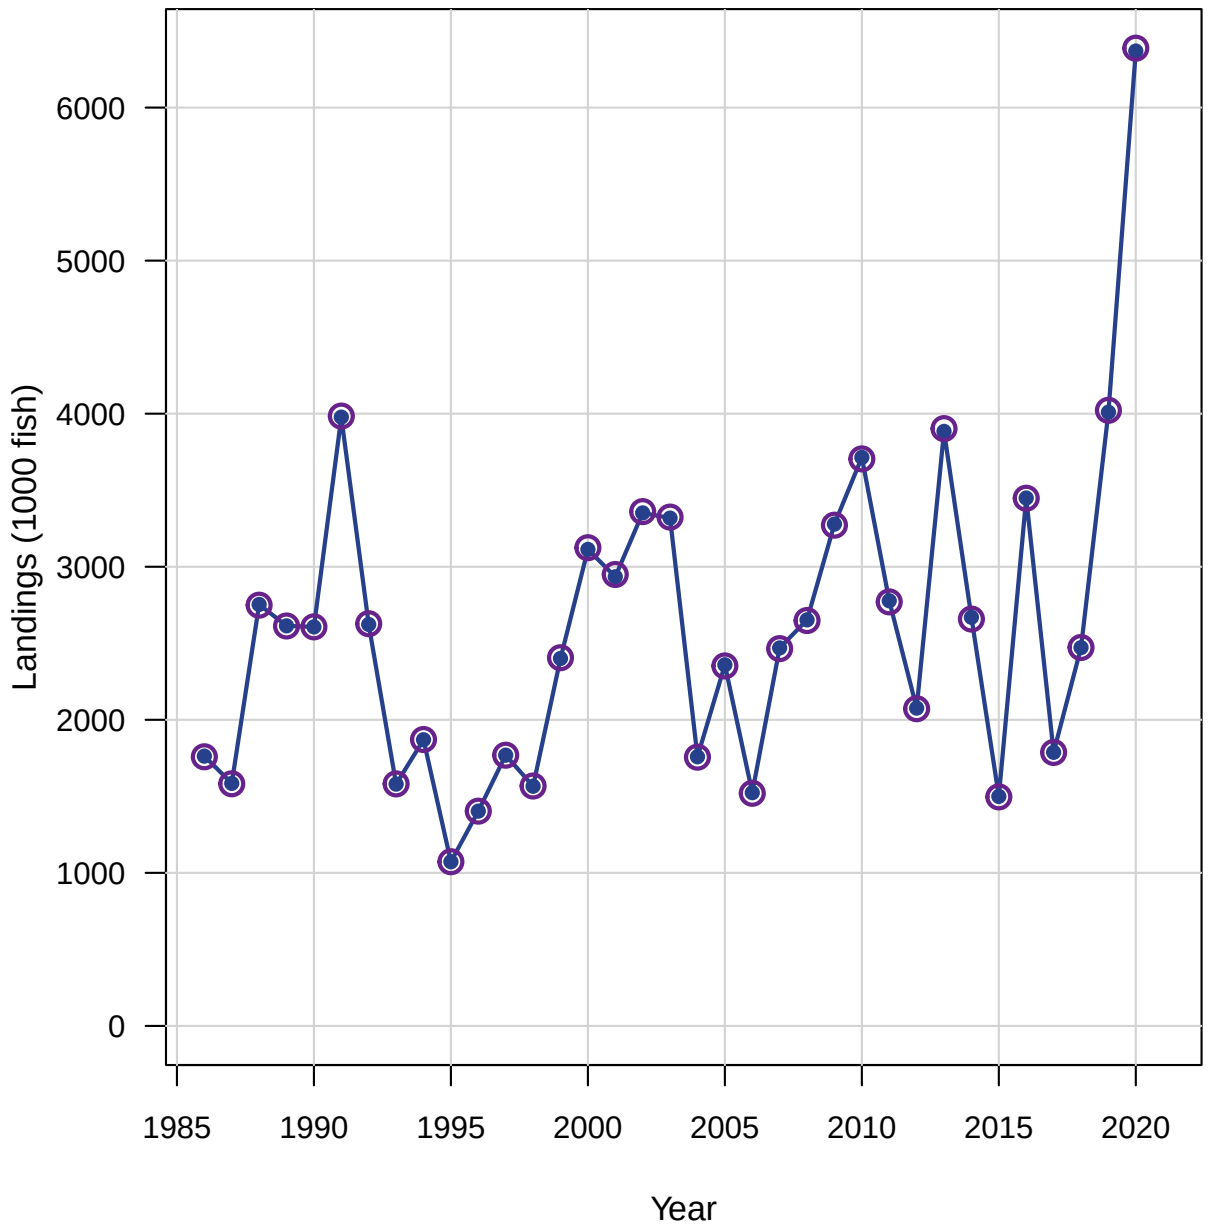

Figure 9. Observed (open circles) and estimated (line, solid circles) recreational discards (1000 fish).

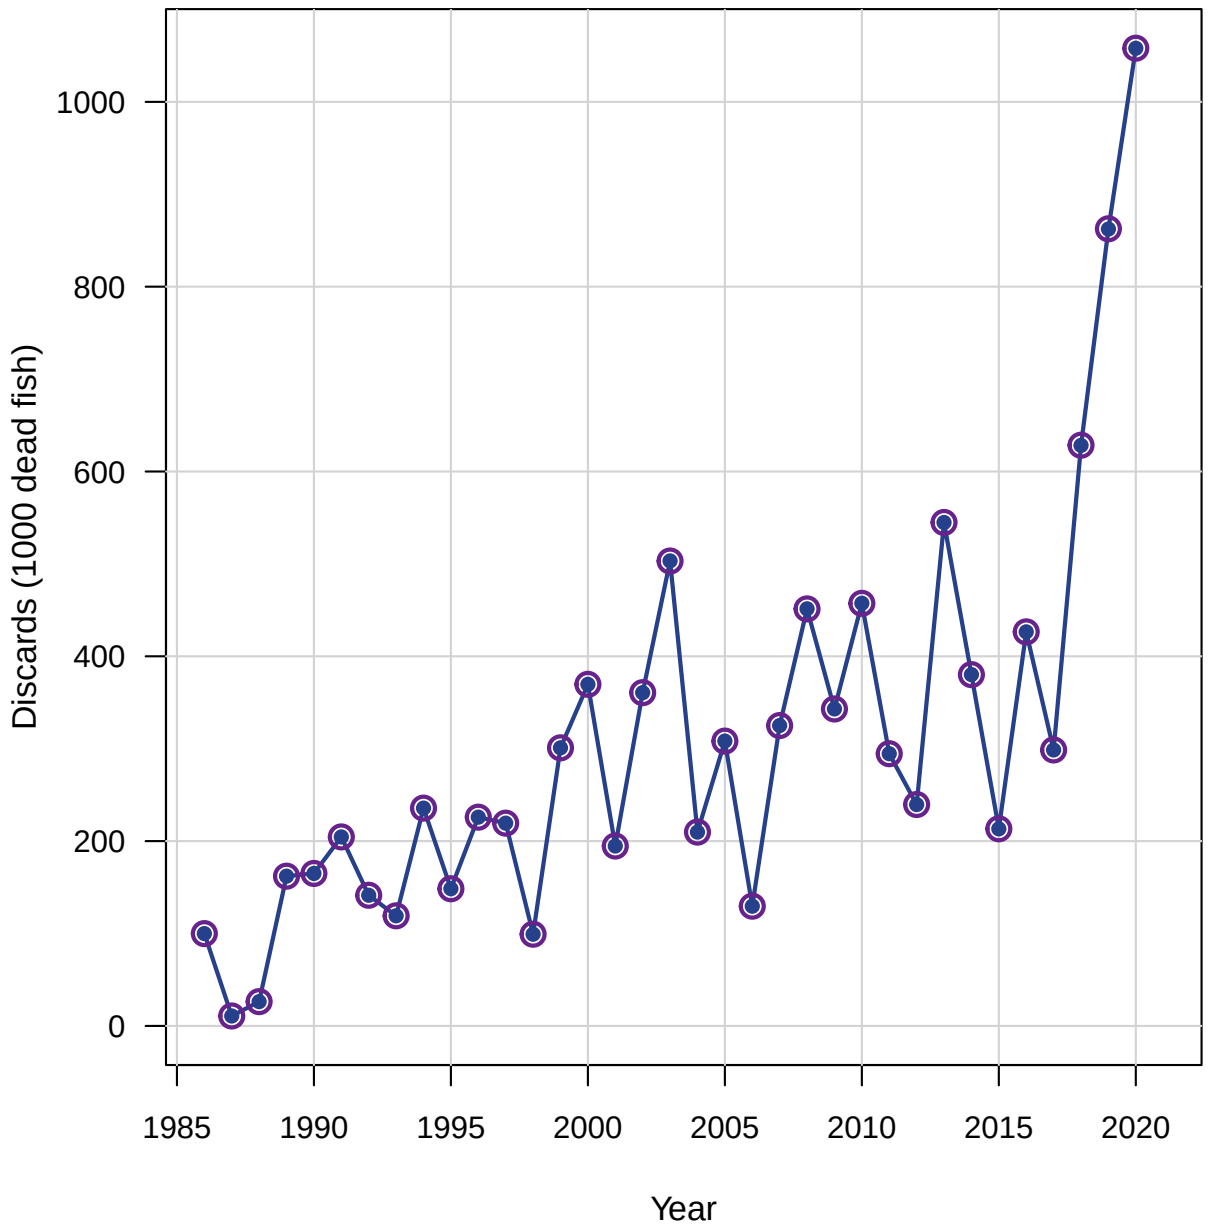

Figure 10. Observed (open circles) and estimated (line, solid circles) discards from shrimp bycatch (1000 fish).

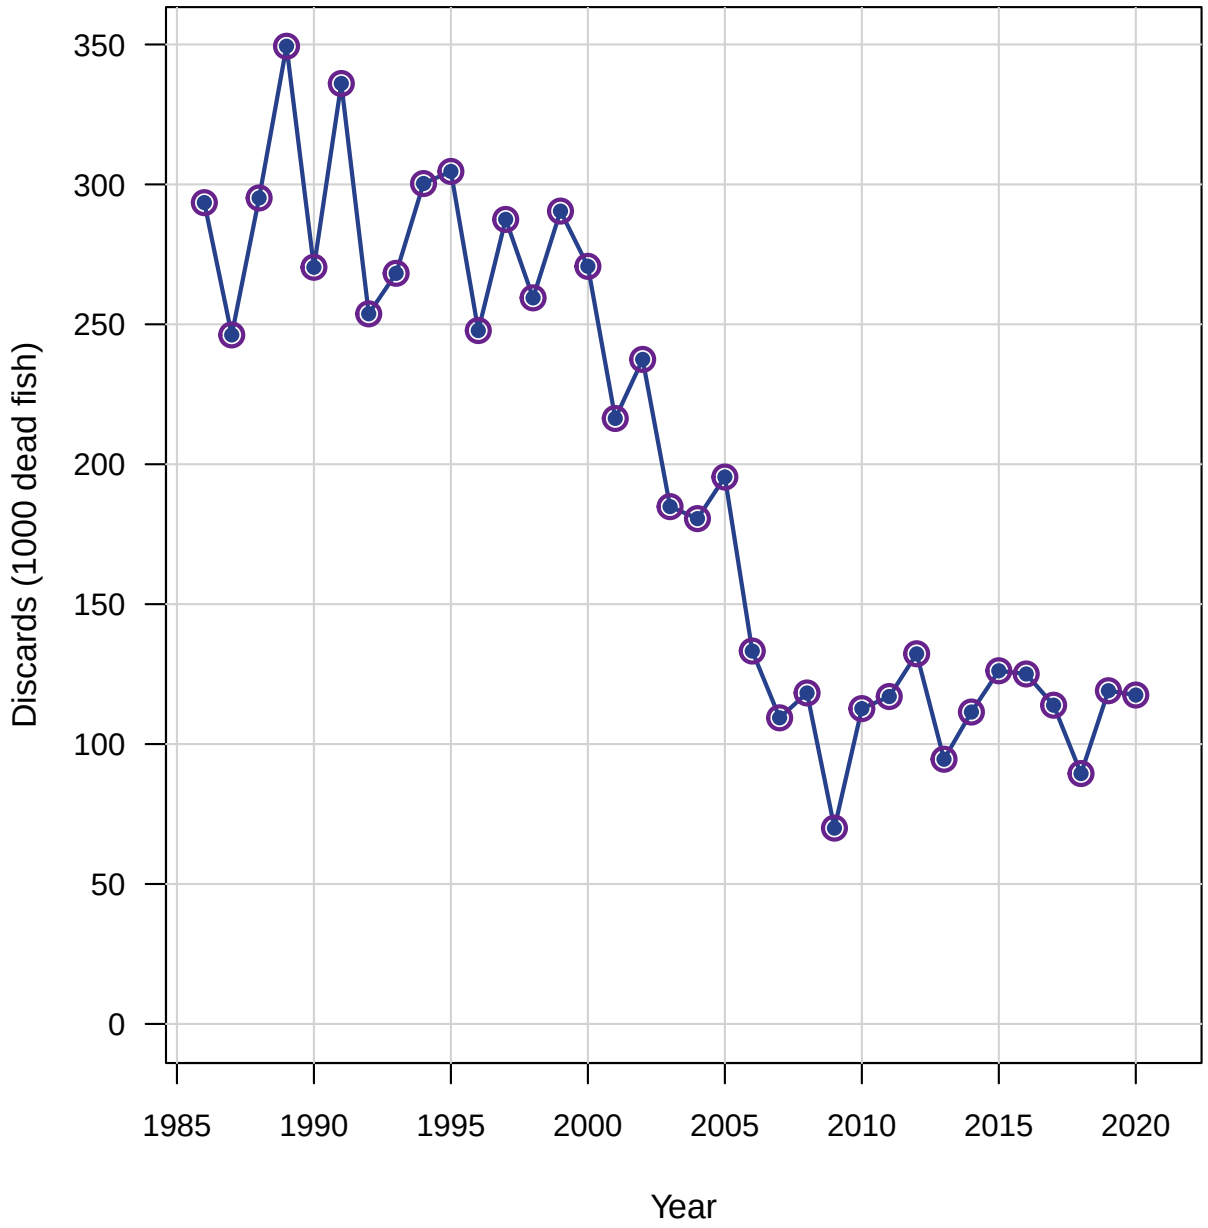

Figure 11. Top Panel: Observed (open circles) and estimated (line, solid circles) index of abundance from Florida commercial handline trip tickets. Bottom panel: Scaled residuals of estimated index of abundance. The model input CVs were modified from the input values by the SDNR weights.

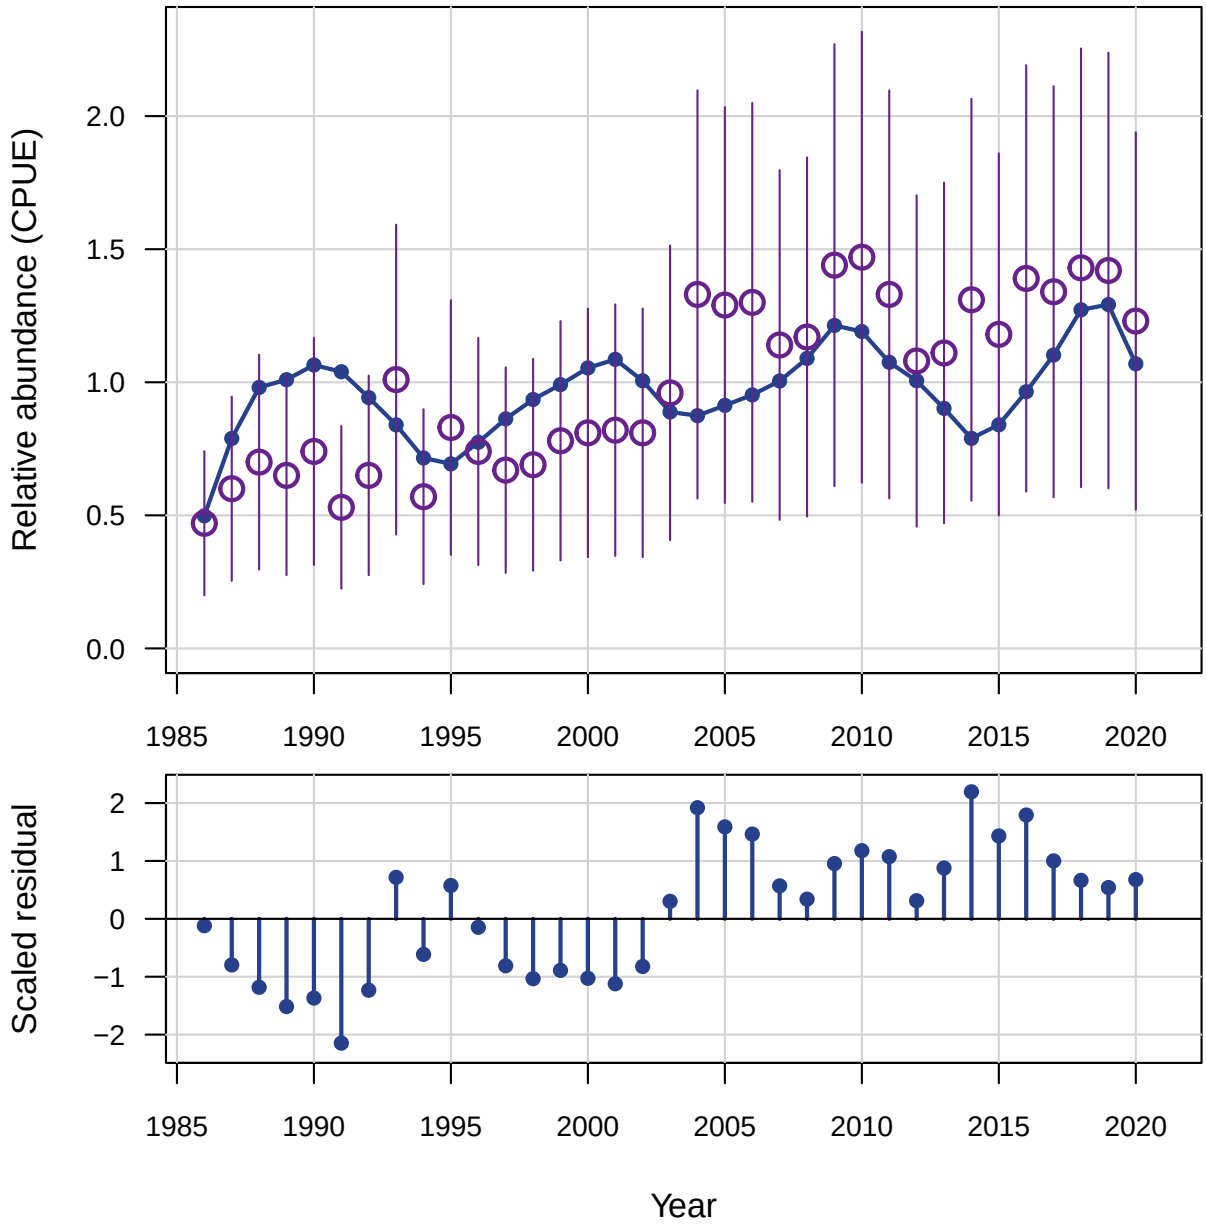

Figure 12. Top Panel: Observed (open circles) and estimated (line, solid circles) index of abundance from MRIP harvested fish. Bottom panel: Scaled residuals of estimated index of abundance. The model input CVs were modified from the input values by the SDNR weights.

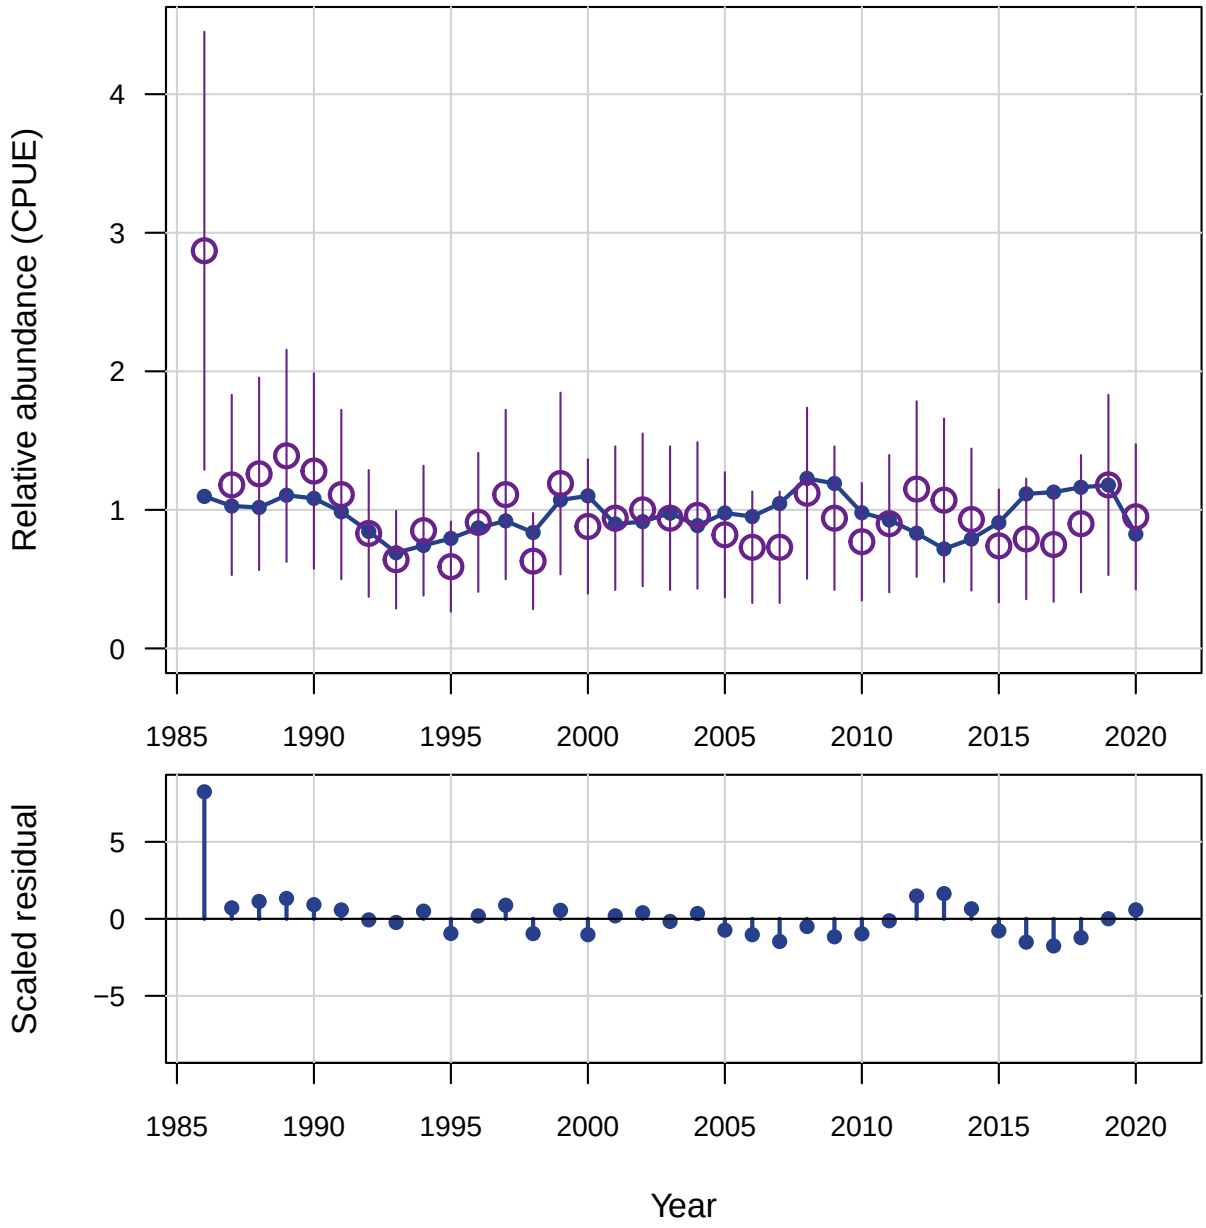

Figure 13. Top Panel: Observed (open circles) and estimated (line, solid circles) index of abundance from SEAMAP YOY samples. Bottom panel: Scaled residuals of estimated index of abundance. The model input CVs were modified from the input values by the SDNR weights.

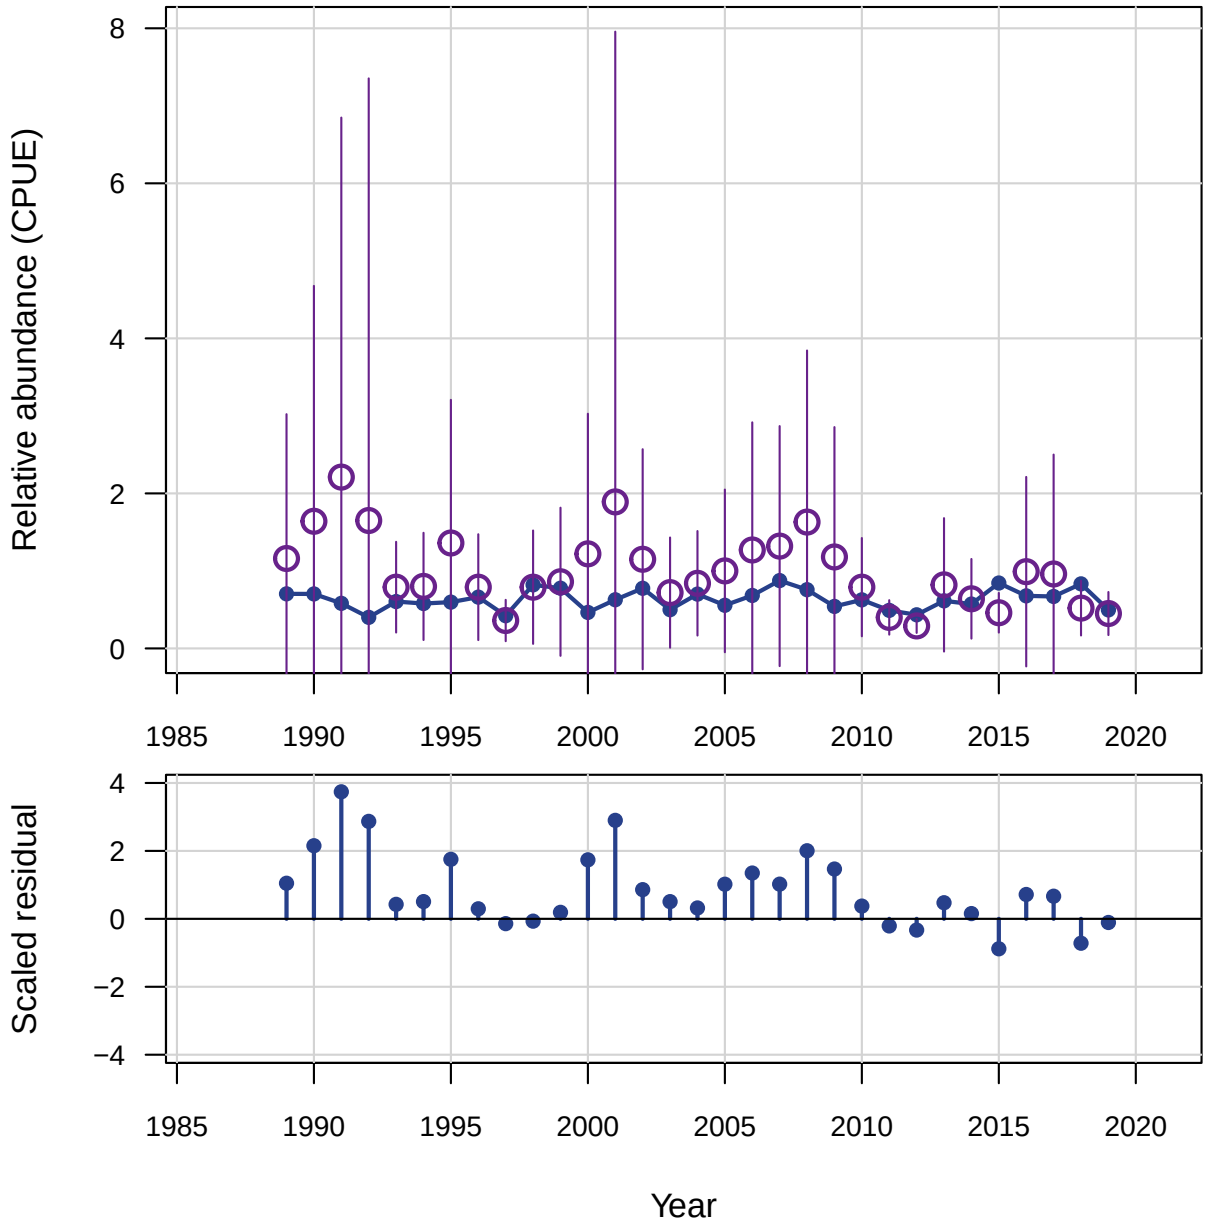

Figure 14. Estimated abundance at age at start of year.

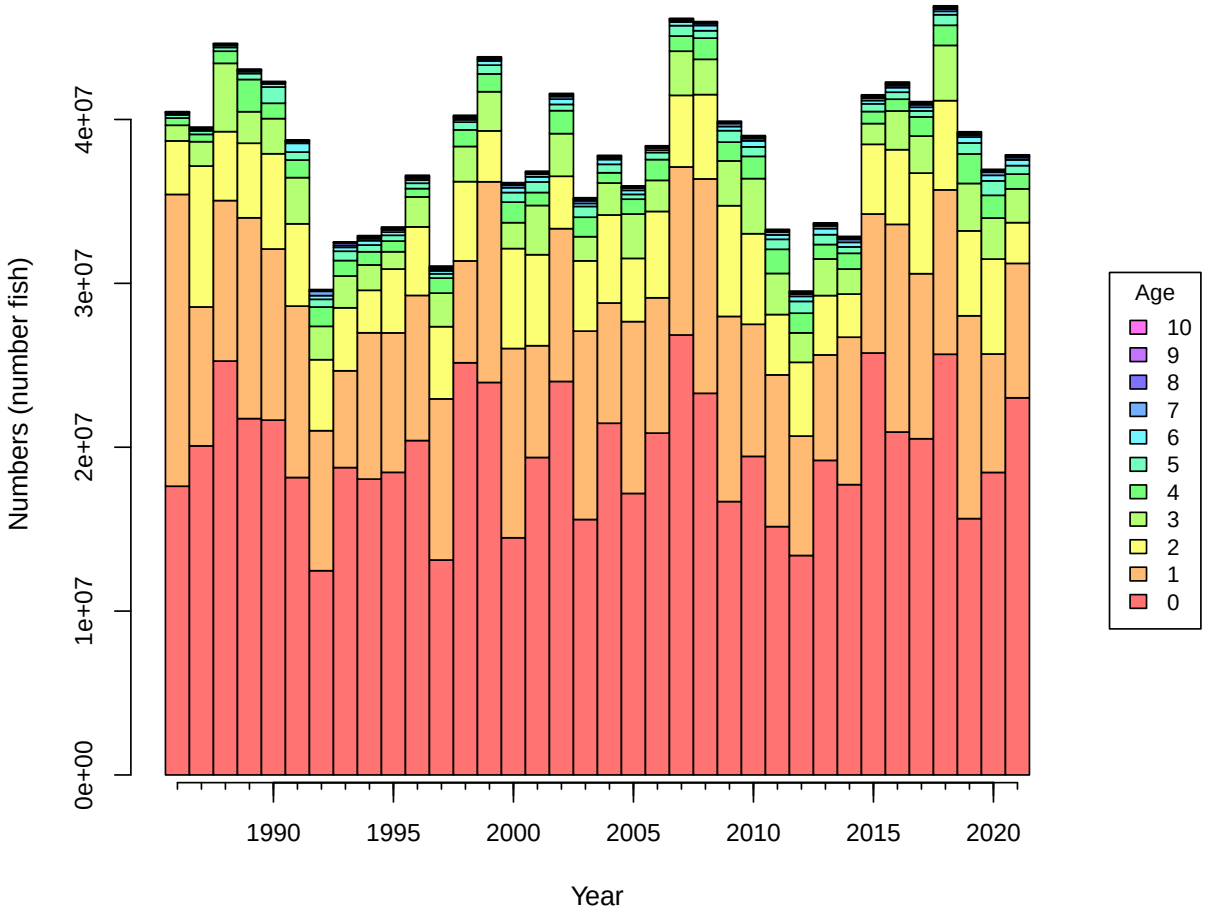

Figure 15. Top panel: Estimated recruitment of age-0 fish. Horizontal dashed line indicates R_{MSY}. Bottom panel: log recruitment residuals.

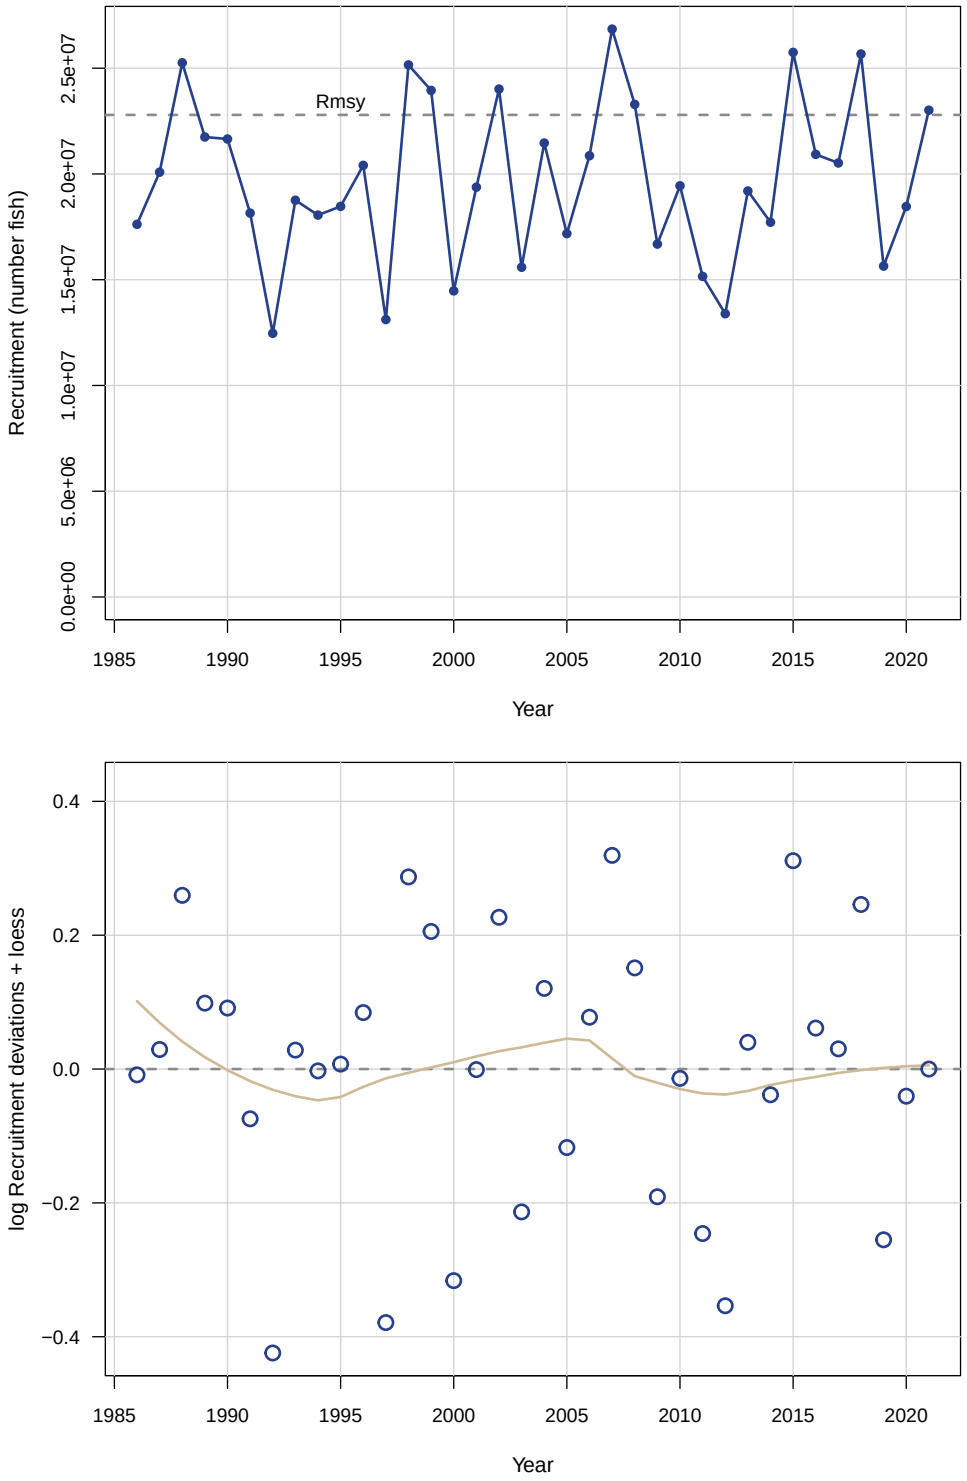

Figure 16. Estimated biomass at age at start of year.

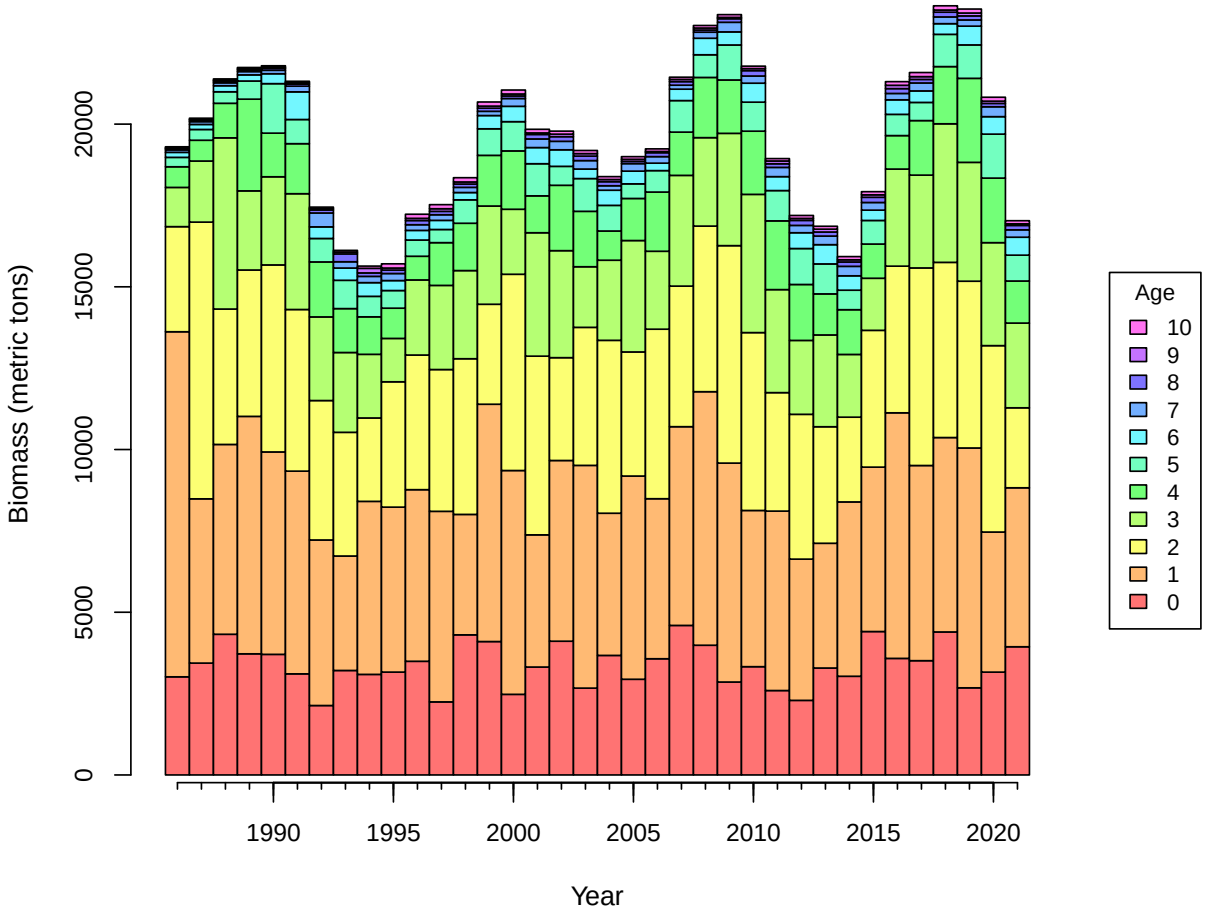

Figure 17. Selectivity of commercial handline fleet for all years in the model. Year indicates start year of the model.

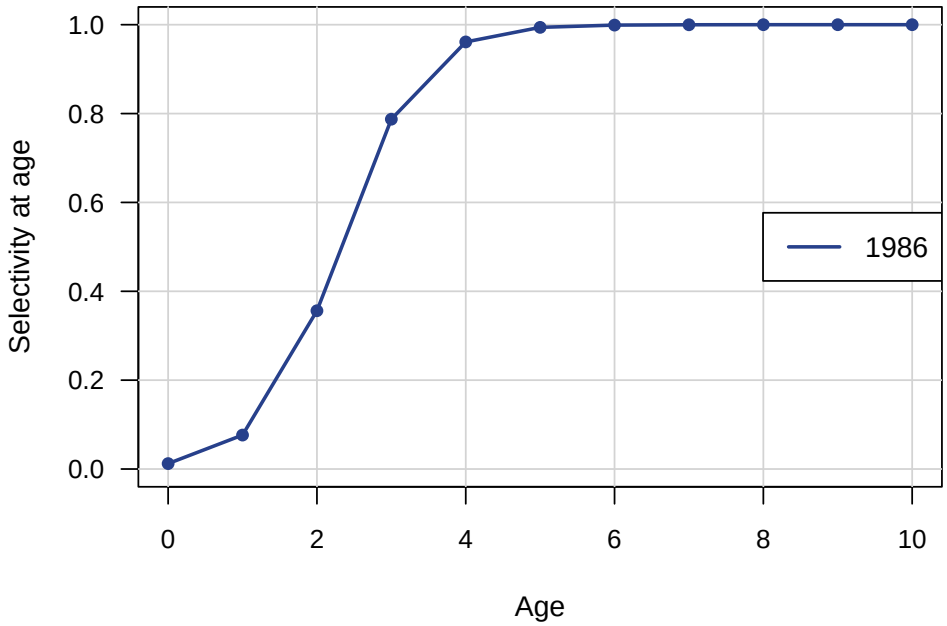

Figure 18. Selectivity of commercial pound net fleet for all years in the model. Year indicates start year of the model.

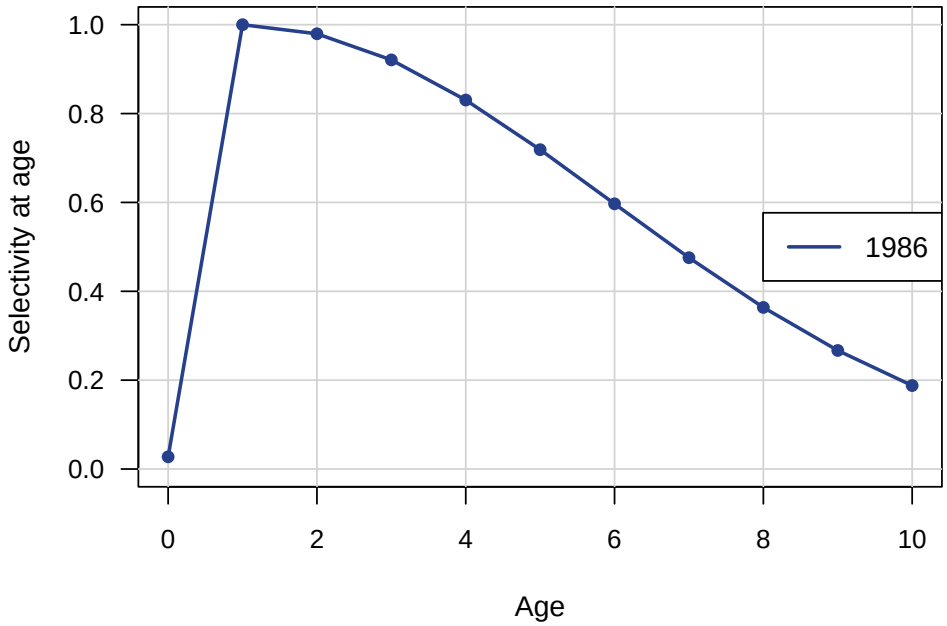

Figure 19. Selectivity of commercial gillnet fleet for all years in the model. Year indicates start year of the model.

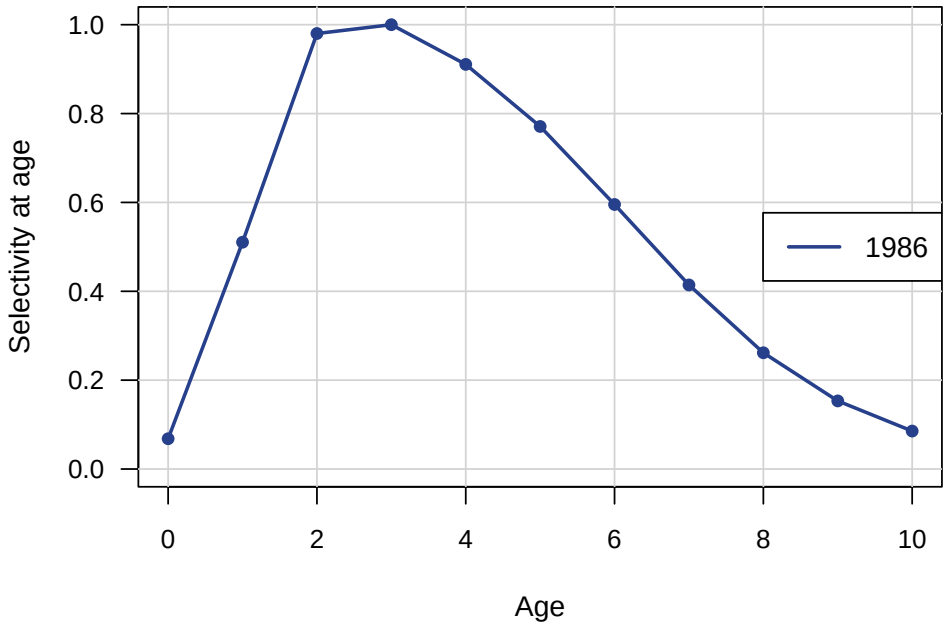

Figure 20. Selectivities of commercial cast net fleet for all years in the model. Year indicates start year of the model.

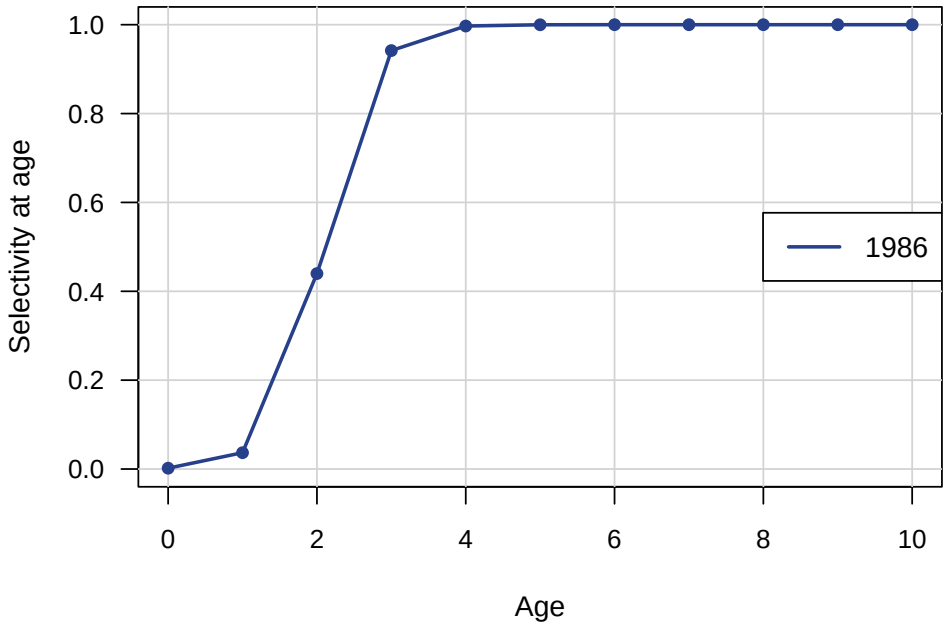

Figure 21. Selectivities of general recreational fishery for all years in the model. Year indicates start year of the model.

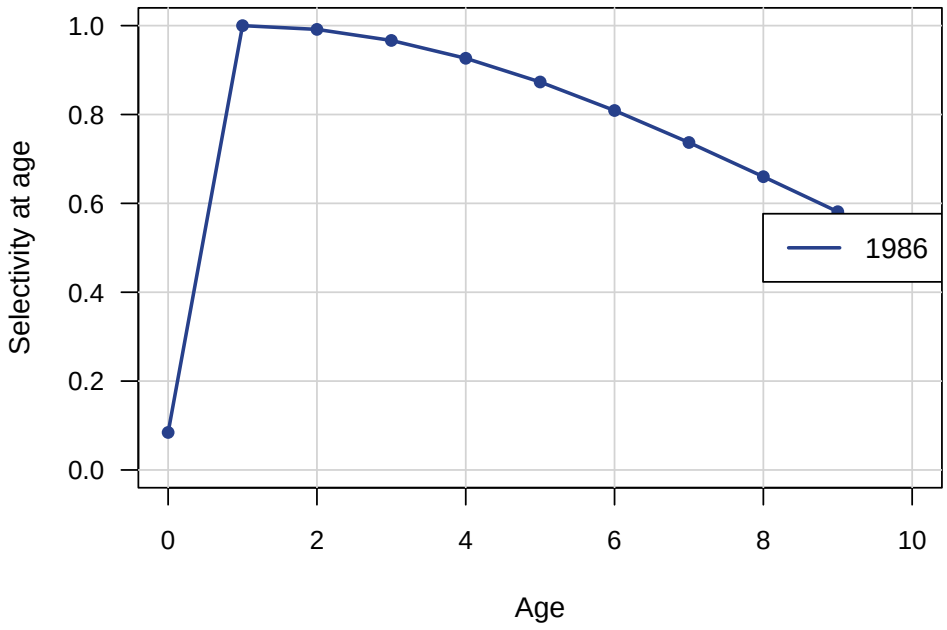

Figure 22. Selectivities of recreational discard for all years in the model. Year indicates start year of the model.

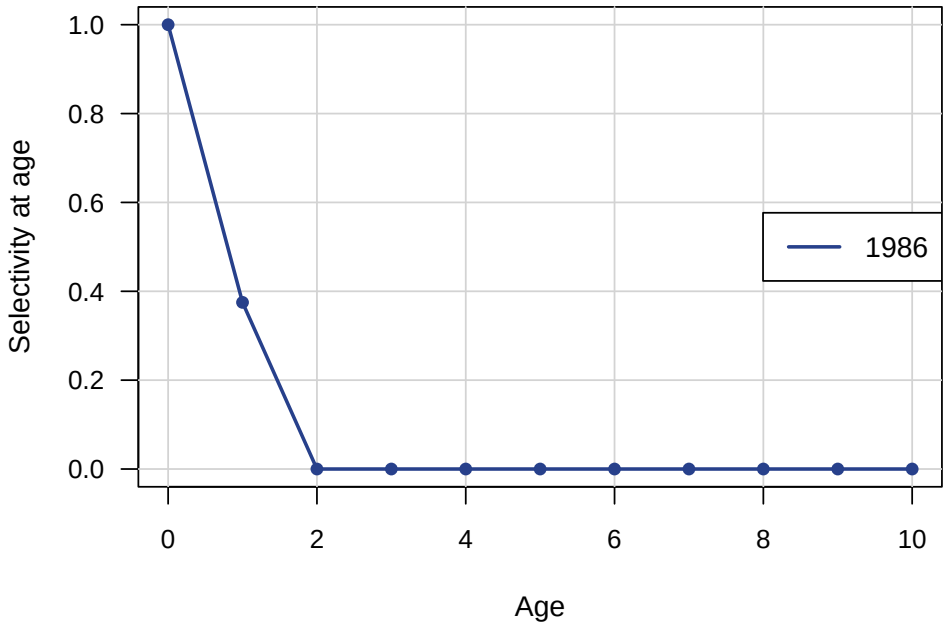

Figure 23. Selectivities of shrimp fishery discard for all years in the model. Year indicates start year of the model.

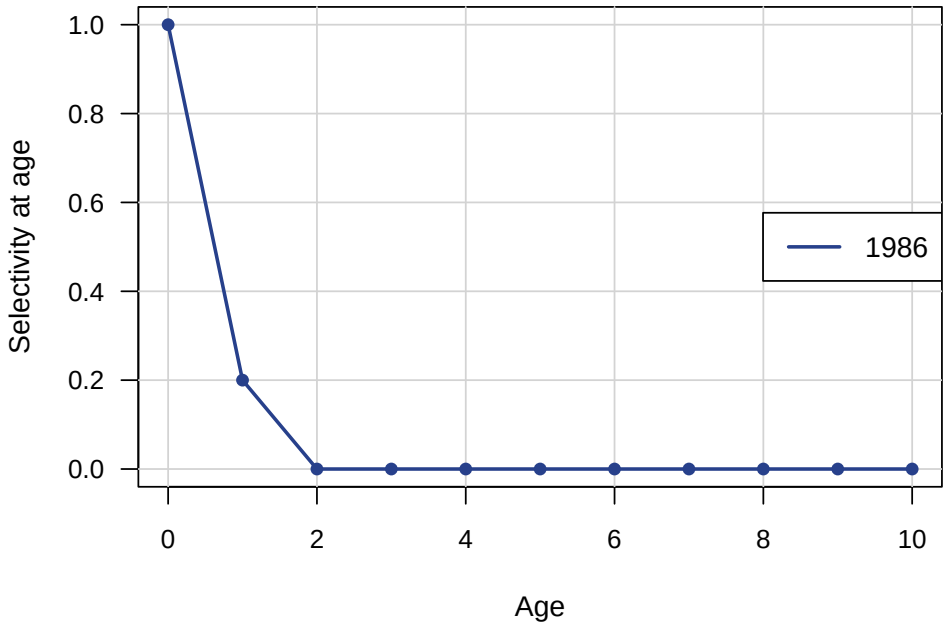

Figure 24. Average selectivity from the terminal assessment year weighted by geometric mean Fs from the last three assessment years for landings (top panel) and discards (bottom panel), and used in computation of benchmarks and central-tendency projections.

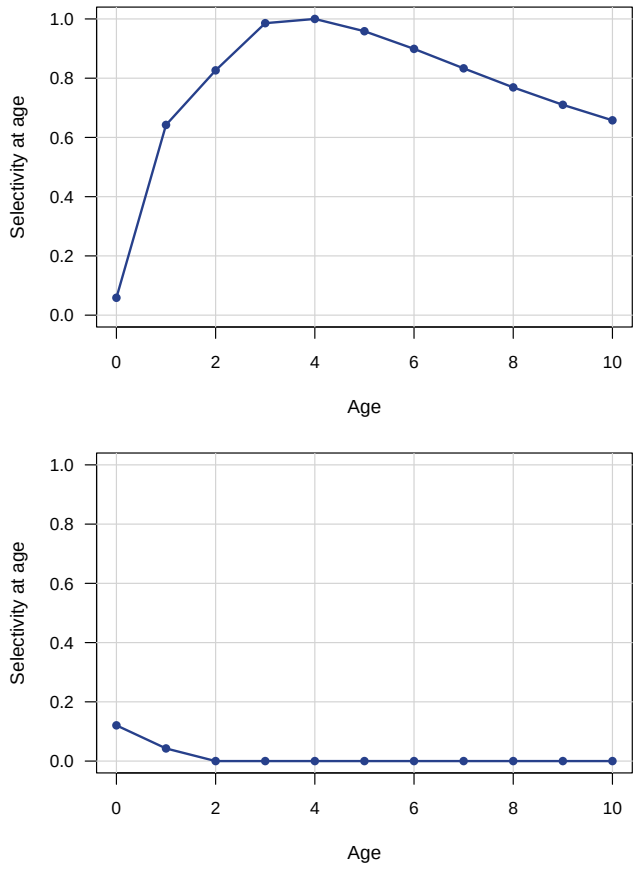

Figure 25. Estimated fully selected fishing mortality rate (per year) by fishery. cH refers to commercial handline, cP to commercial pound net, cG to commercial gill net, cC to commercial cast net, GR for recreational, GR.D for recreational discards, and SB.D for shrimp bycatch. Full F, the maximum F at age summed across fleets, may not equal the sum of fully selected F's because of dome-shaped selectivities.

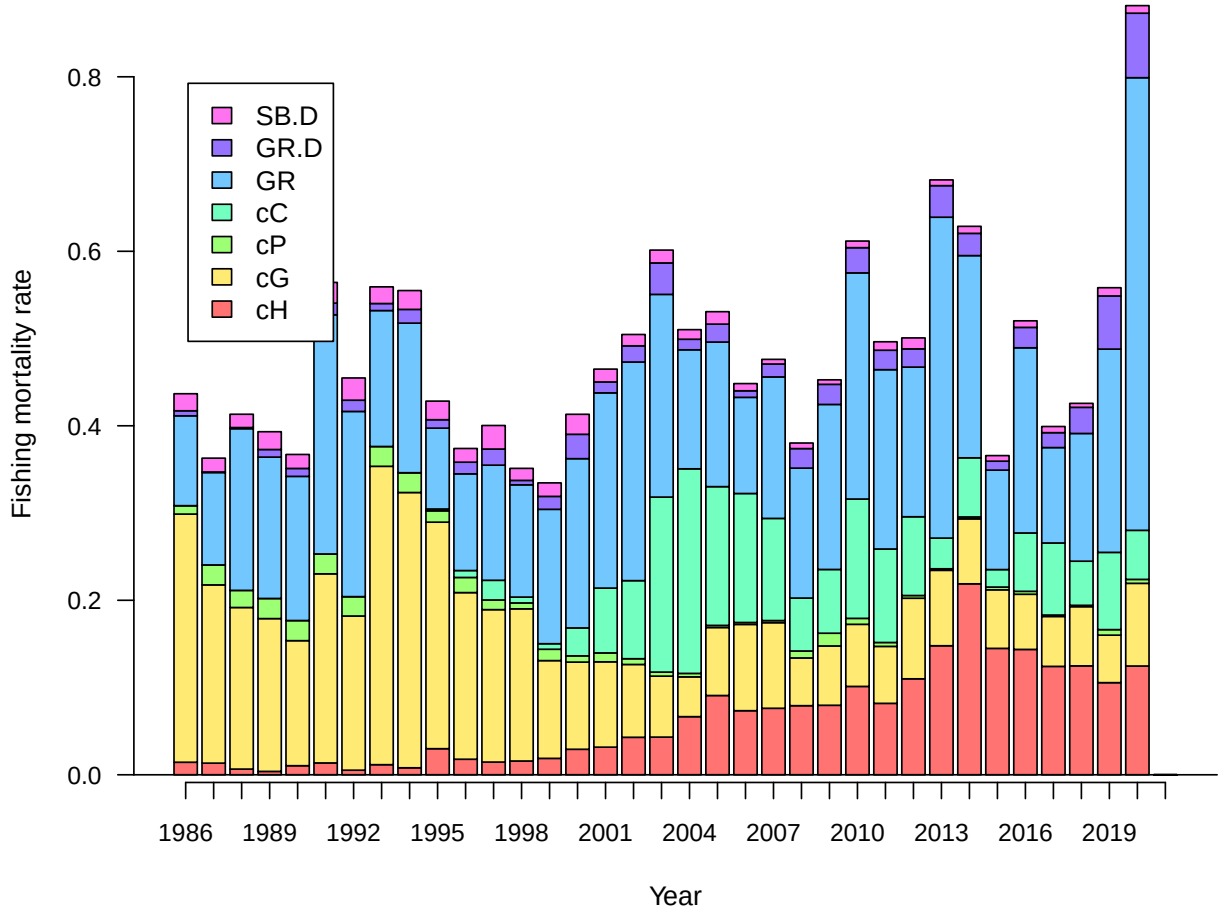

Figure 26. Alternative measures of fishing intensity. Top panel shows equilibrium SPR conditional on annual F, with a reference line at equilibrium MSY*. Bottom panel shows exploitation rate (E) computed as number killed divided total abundance (thick black curve), which can be divided into its components of landings (thin green curve) and dead discards (thin blue curve).*

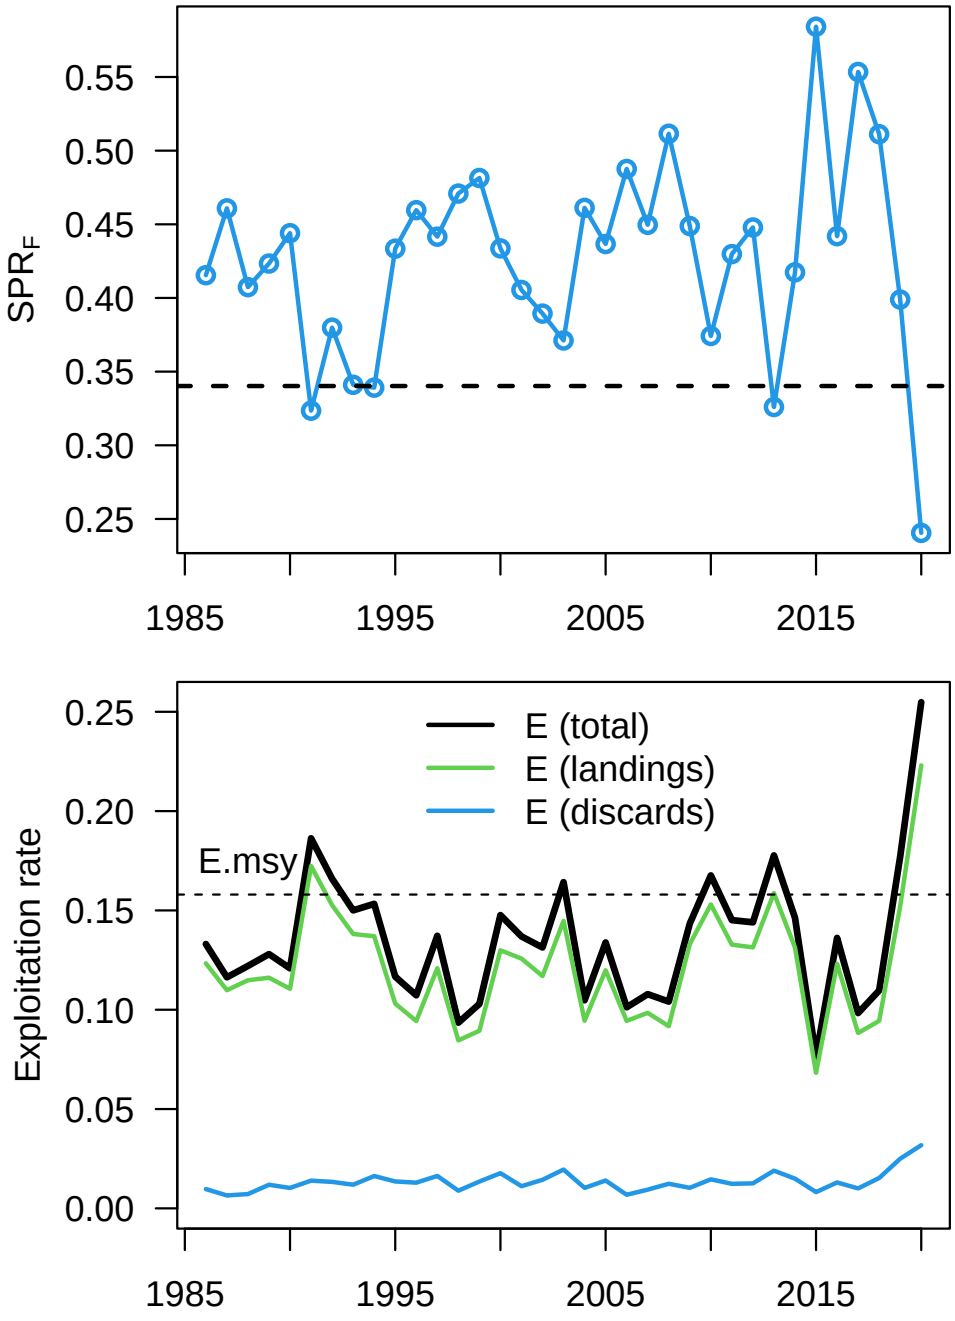

Figure 27. Estimated landings in numbers by fishery from the catch-age model. cH refers to commercial handline, cP to commercial pound net, cG to commercial gill net, cC to commercial cast net, and GR for recreational.

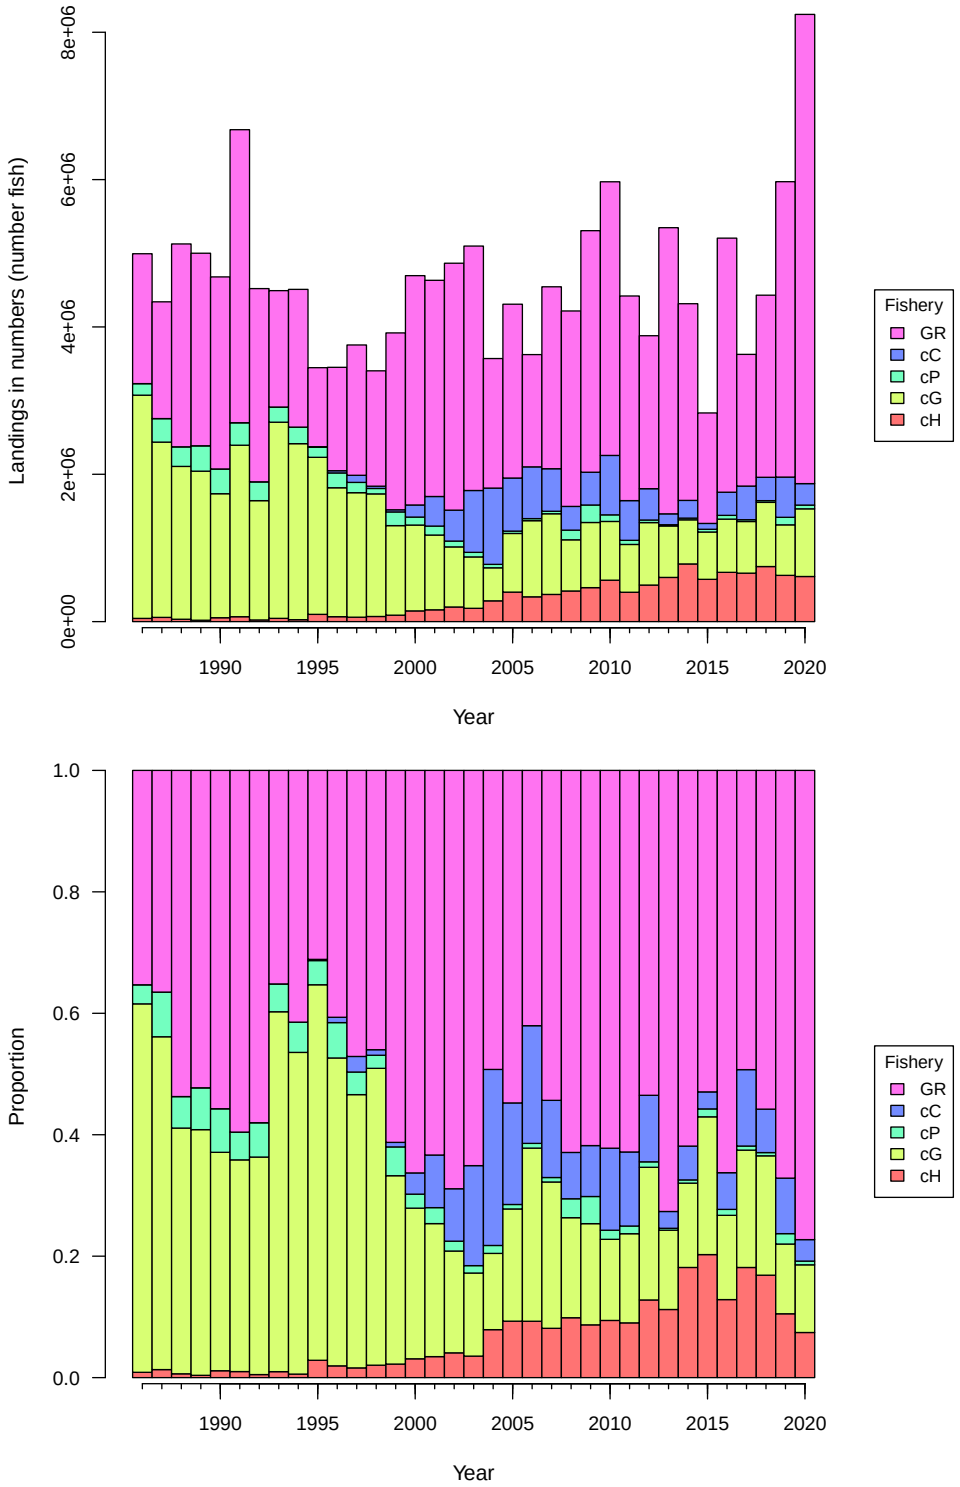

Figure 28. Estimated landings in whole weight by fishery from the catch-age model. cH refers to commercial hand-line, cP to commercial pound net, cG to commercial gill net, cC to commercial cast net, and GR for recreational. Horizontal dashed line in the top panel corresponds to the point estimate of MSY.

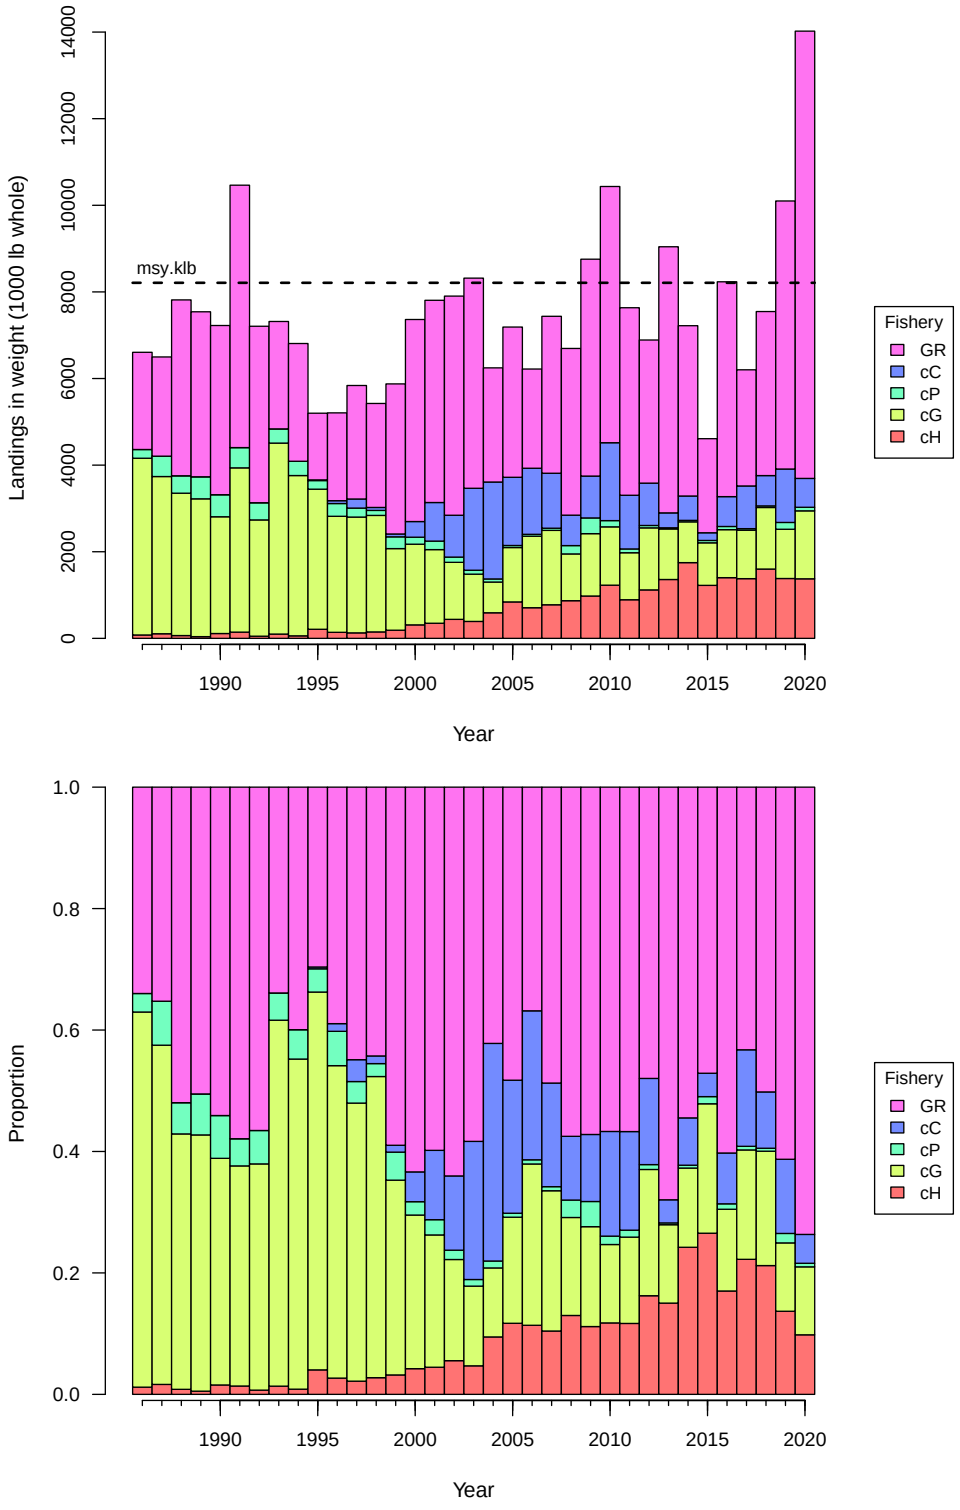

Figure 29. Estimated discards in numbers by fishery from the catch-age model. SB refers to shrimp bycatch, and GR for recreational.

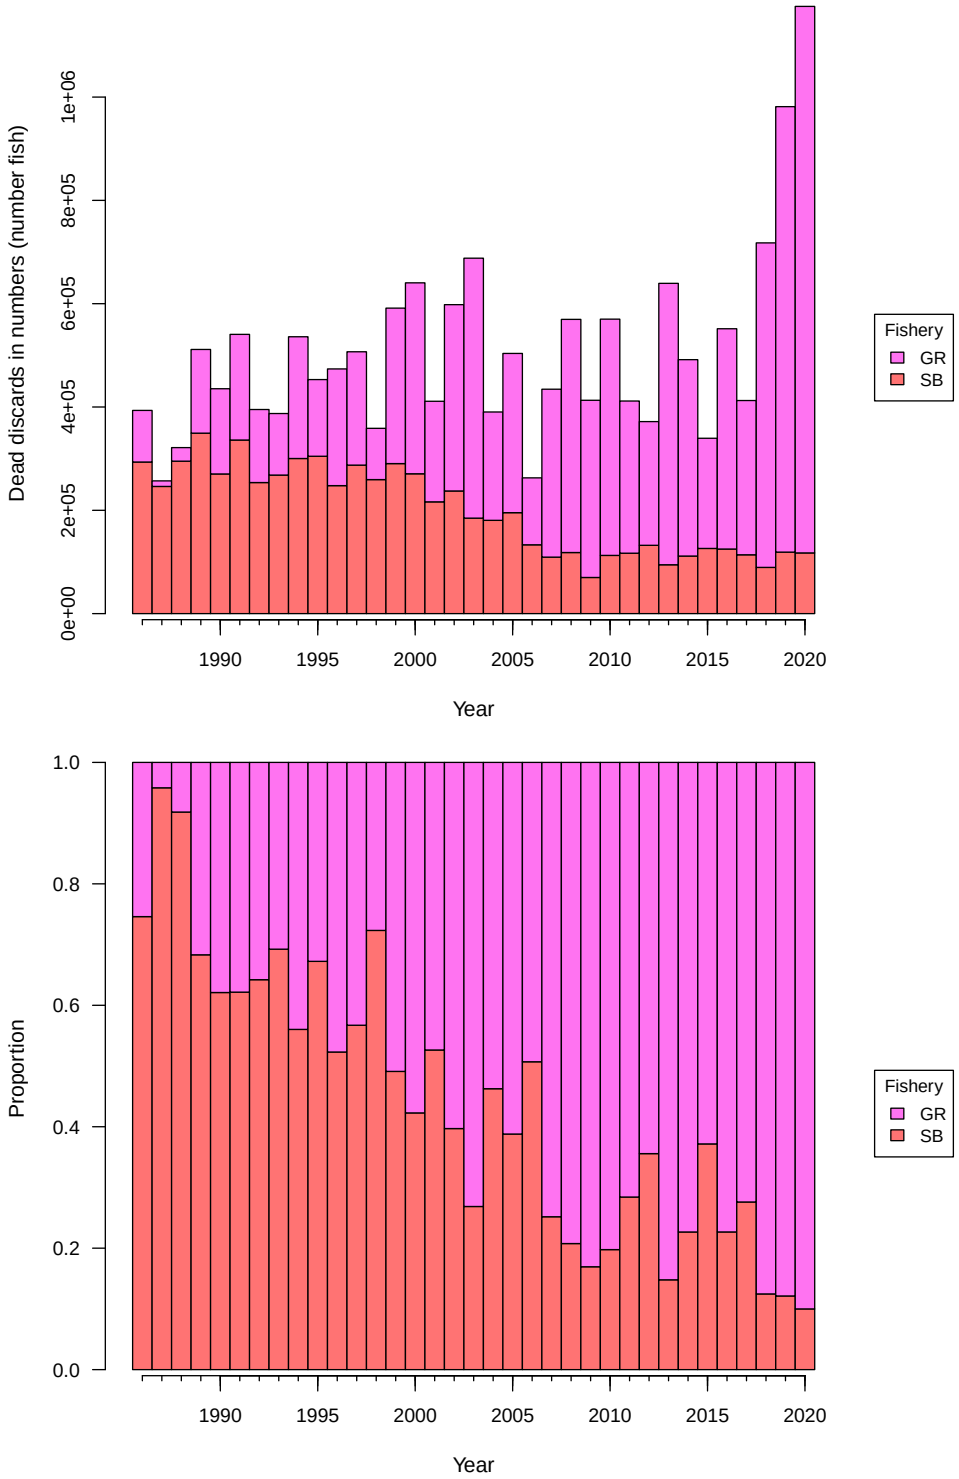

Figure 30. Estimated discards in whole weight by fishery from the catch-age model. SB refers to shrimp bycatch, and GR for recreational.

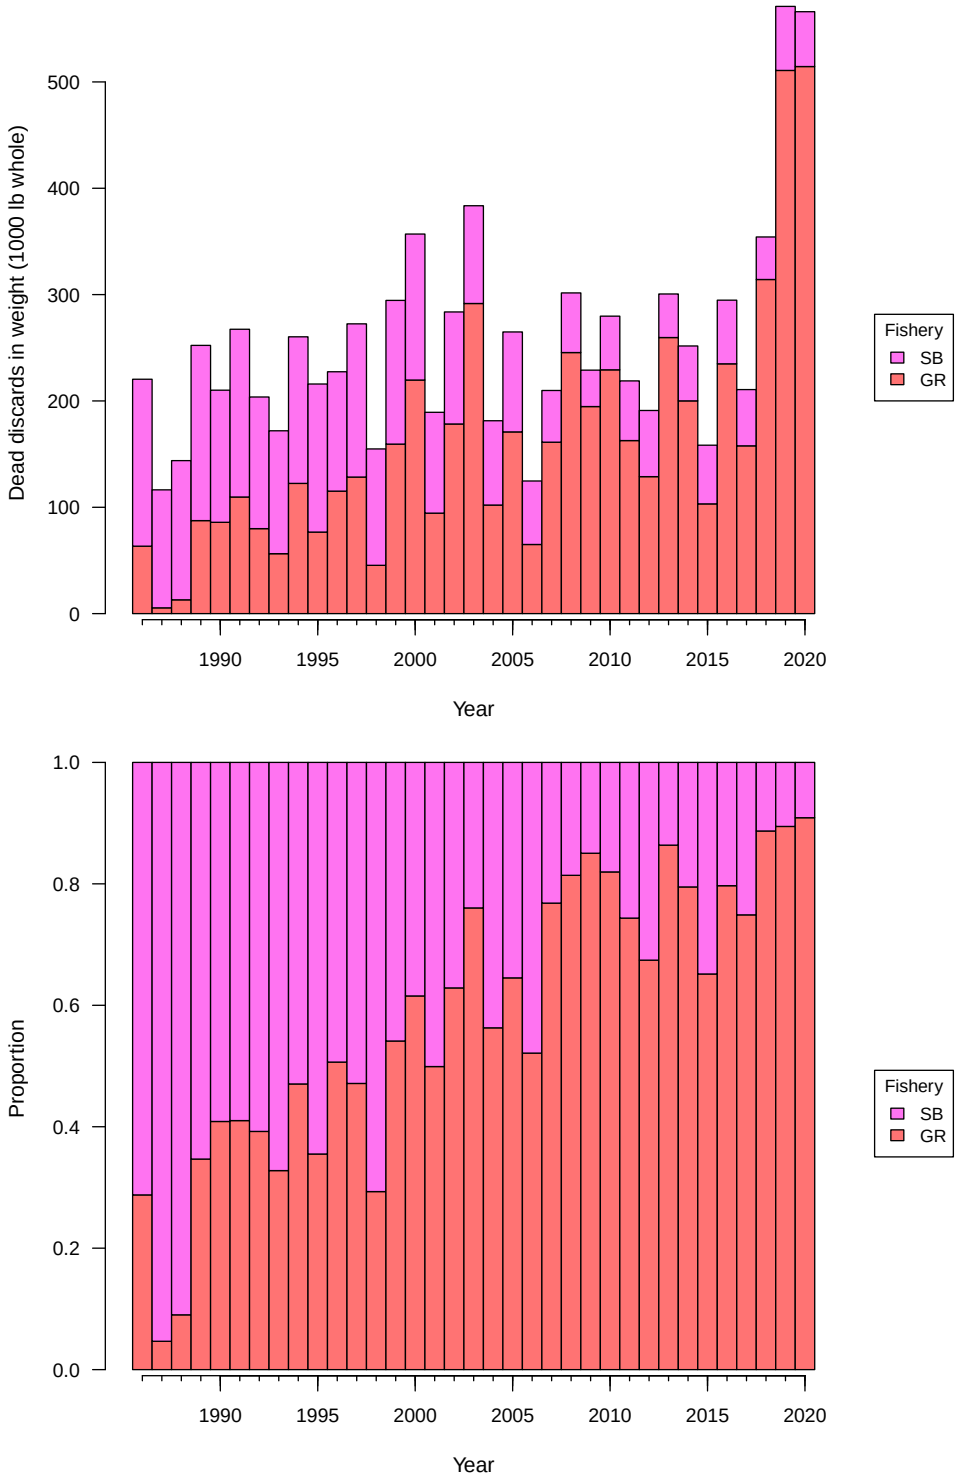

Figure 31. Top panel: Beverton–Holt spawner-recruit curves, with and without lognormal bias correction. The expected (upper) curve was used for computing management benchmarks. Years within panel indicate year of recruitment generated from spawning biomass one year prior. Bottom panel: log of recruits (number age-0 fish) per spawner (mature female gonad weight) as a function of spawners.

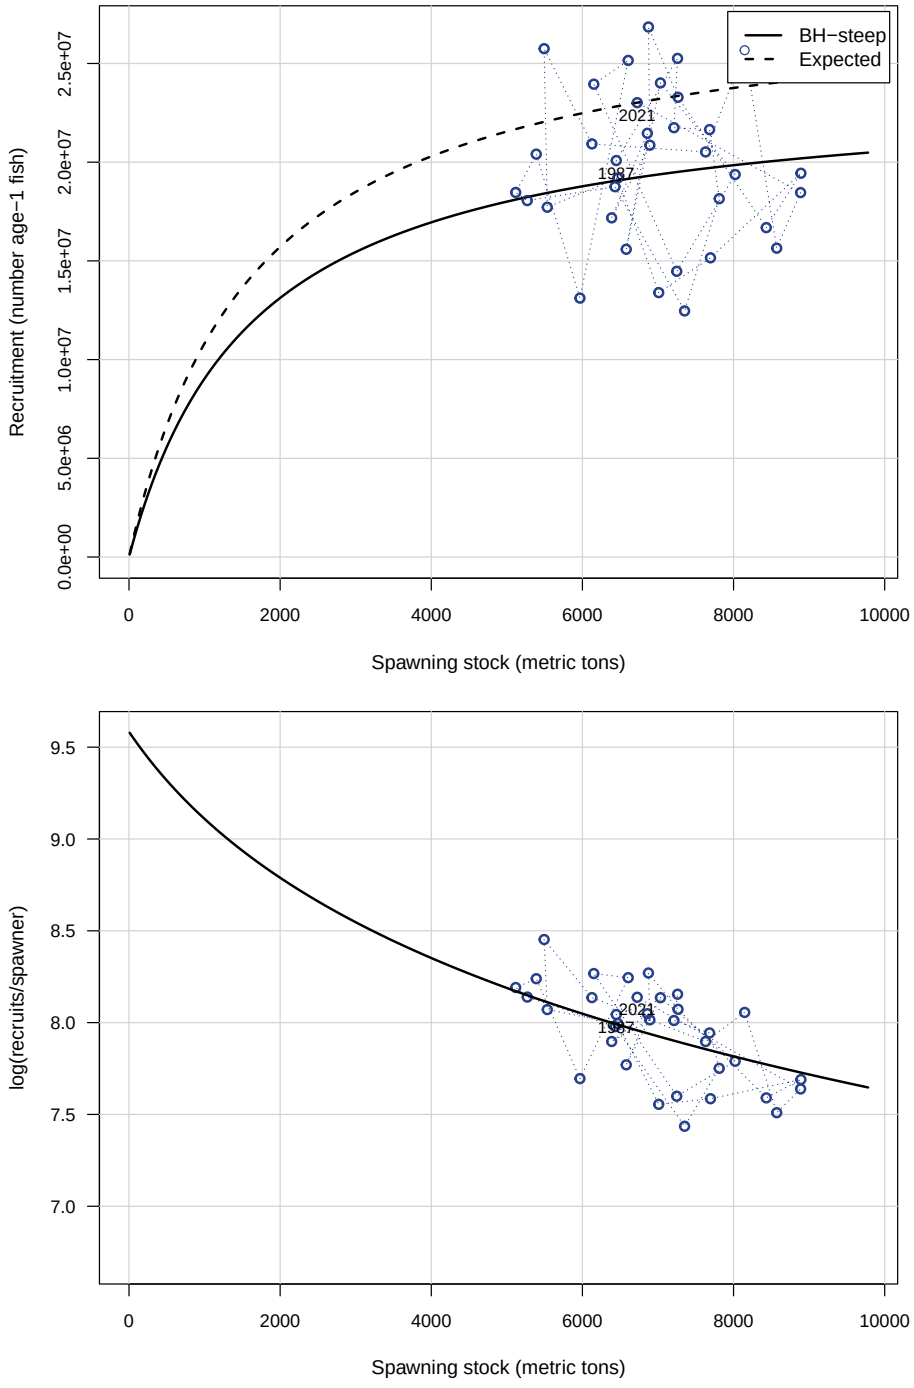

Figure 32. Probability densities of spawner-recruit quantities: Mean recruits (R0, age-0 fish), median recruits, and unfished spawners per recruit. Solid vertical lines represent point estimates or values from the base run of the Beaufort Assessment Model; dashed vertical lines represent medians from the MCBE runs.

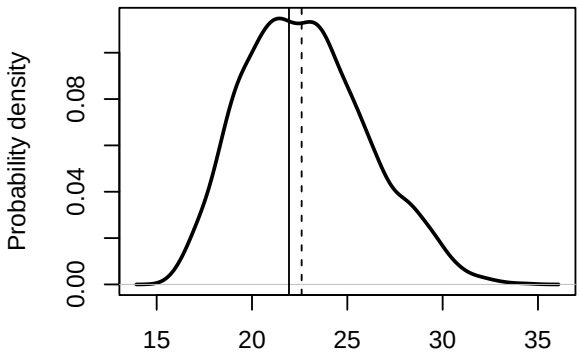

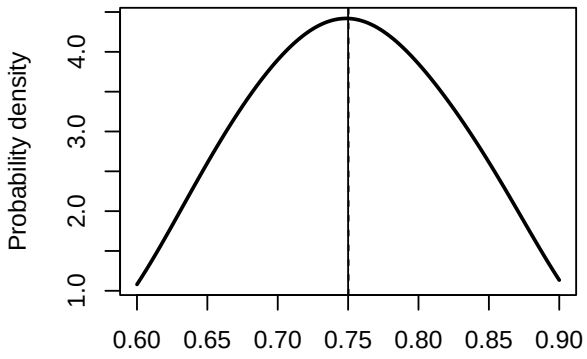

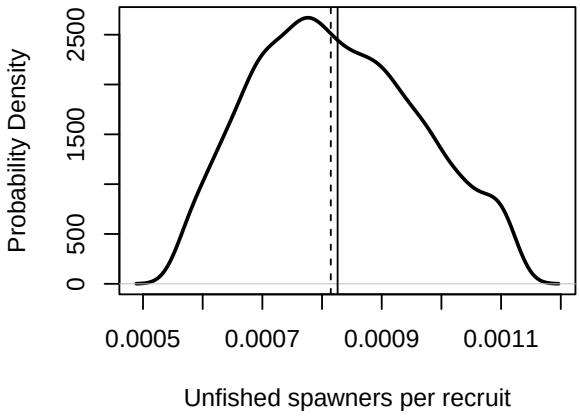

Figure 33. Top panel: yield per recruit. Bottom panel: spawning potential ratio (spawning biomass per recruit relative to that at the unfished level), from which the y% levels provide $F_{y\%}$. Current F (Fcur) is the geometric mean full F from the last 3 years of the assessment. Both curves are based on average selectivity from the end of the assessment period.

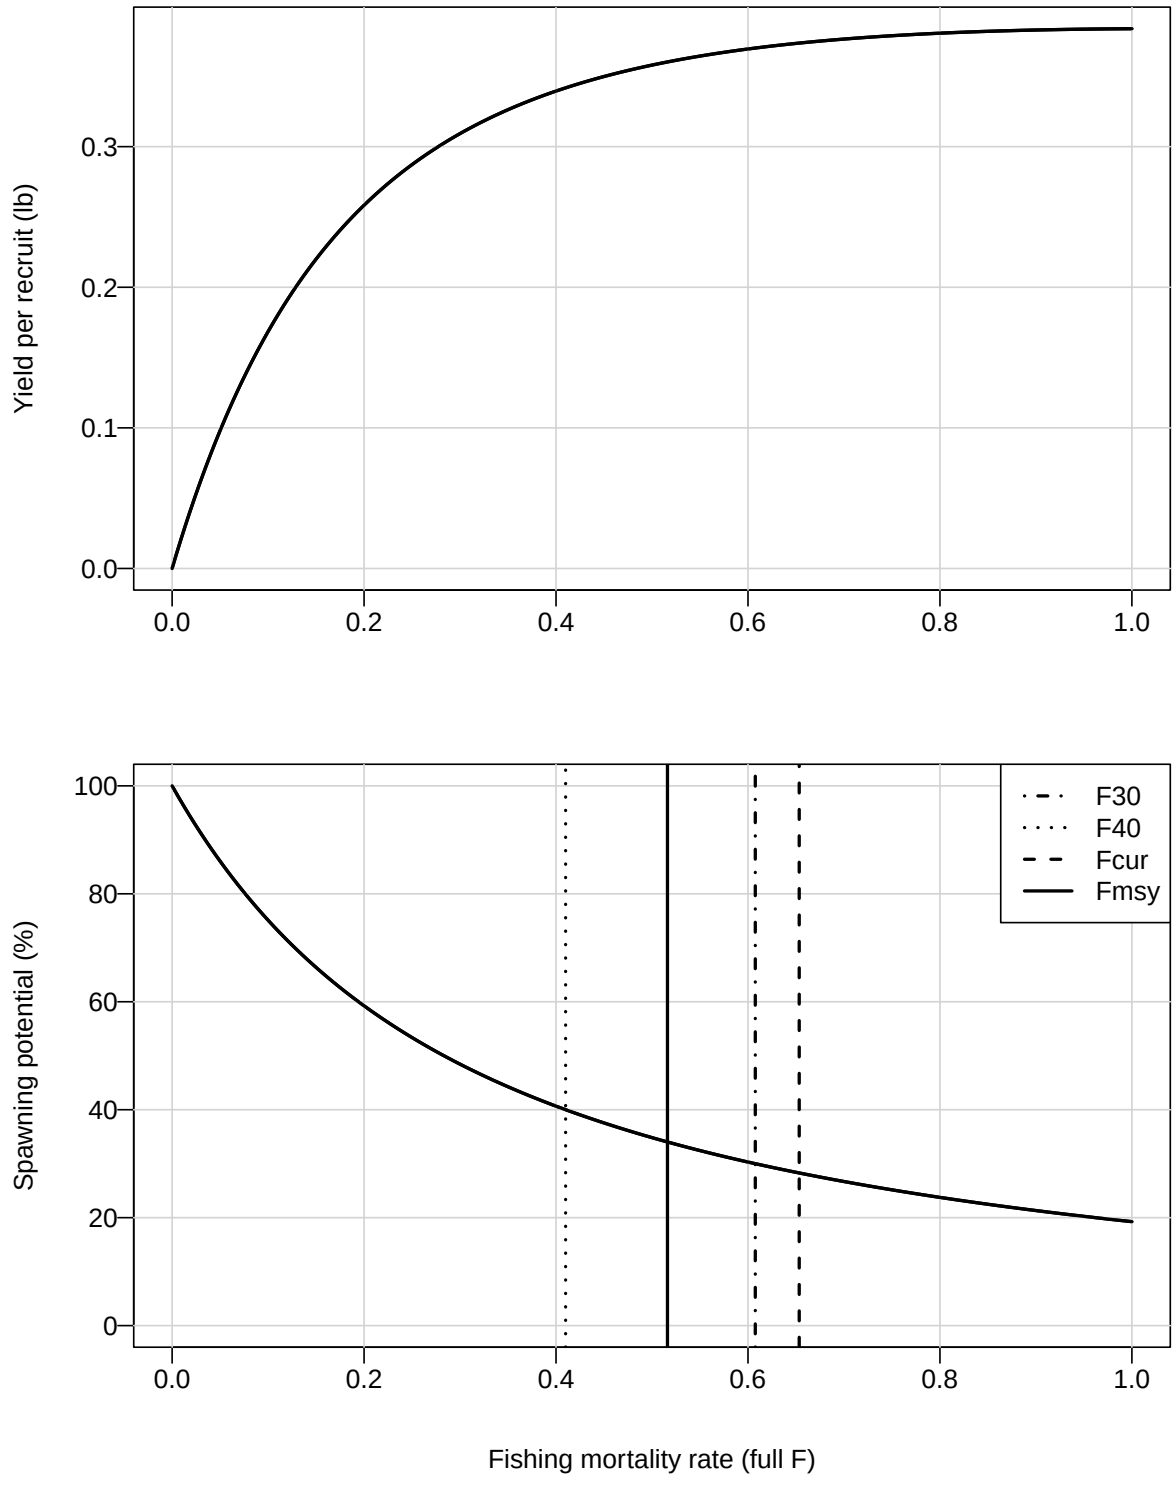

Figure 34. Top panel: equilibrium landings. The peak occurs where fishing rate is $F_{\mathrm{MSY}} = 0.52$ *and equilibrium landings are* MSY = 8210.19 *(1000 lb). Bottom panel: equilibrium spawning biomass. Both curves are based on average selectivity from the end of the assessment period.*

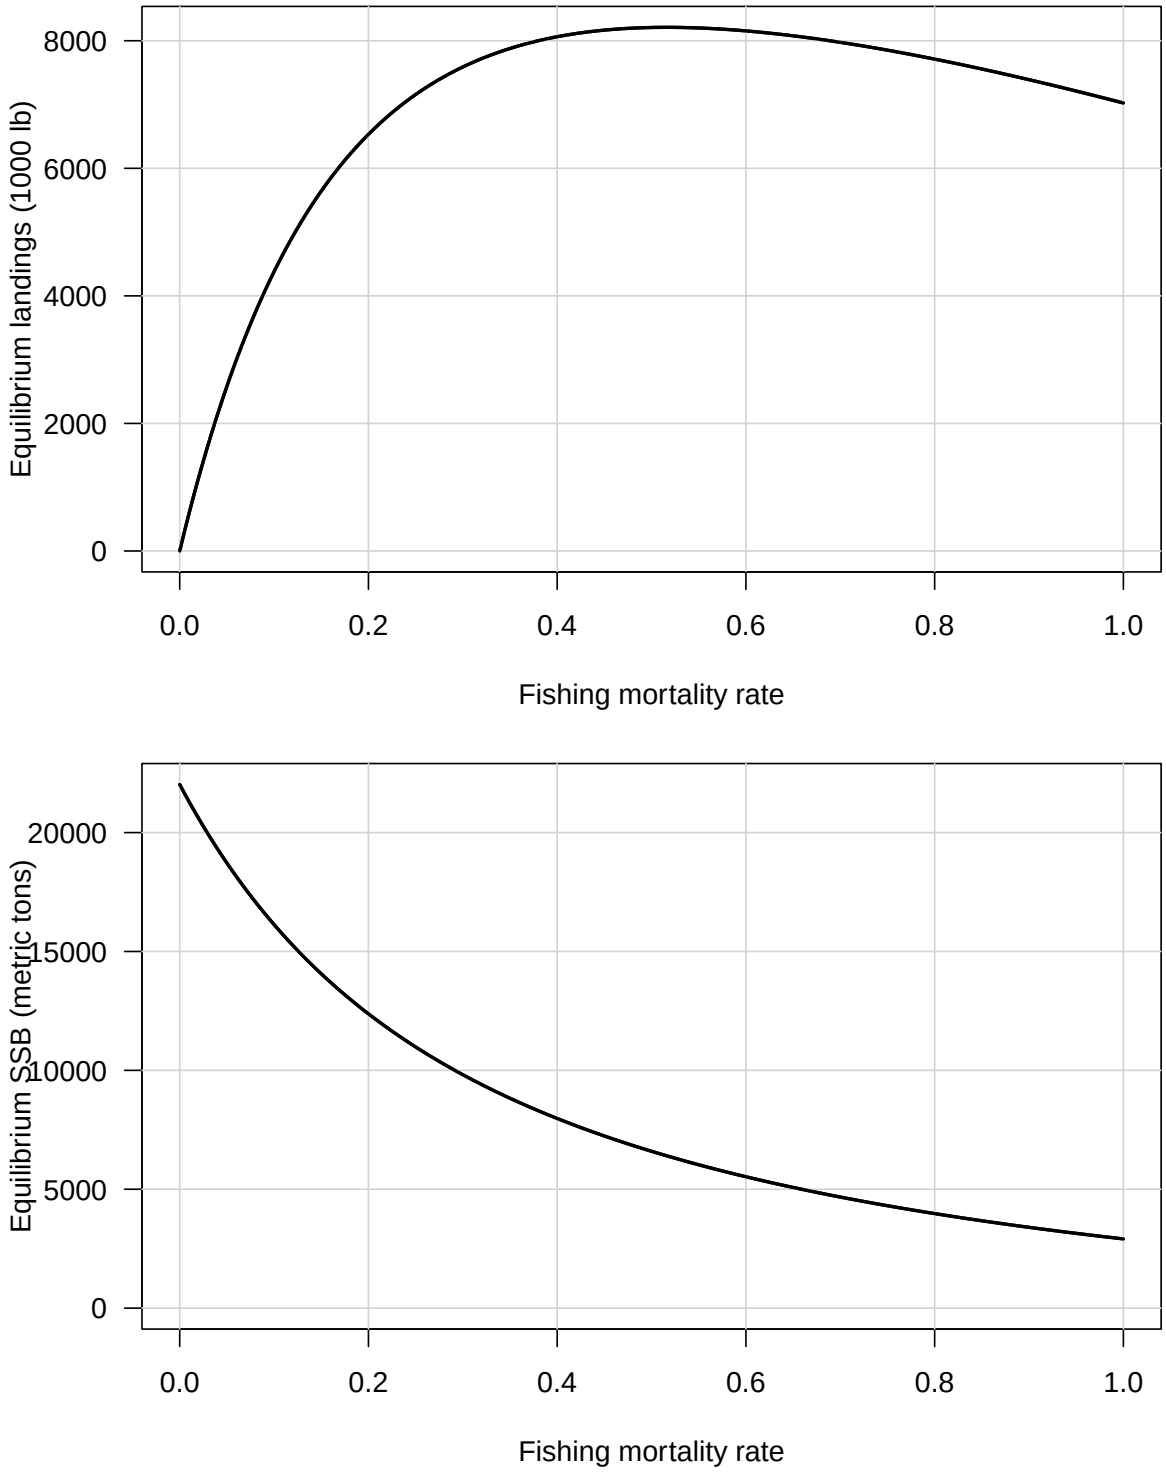

Figure 35. Equilibrium landings as a function of equilibrium biomass, which itself is a function of fishing mortality rate. The peak occurs where equilibrium biomass is $B_{\mathrm{MSY}} = 19588.3$ *mt and equilibrium landings are* $\mathrm{MSY} = 8210.19$ *(1000 lb).*

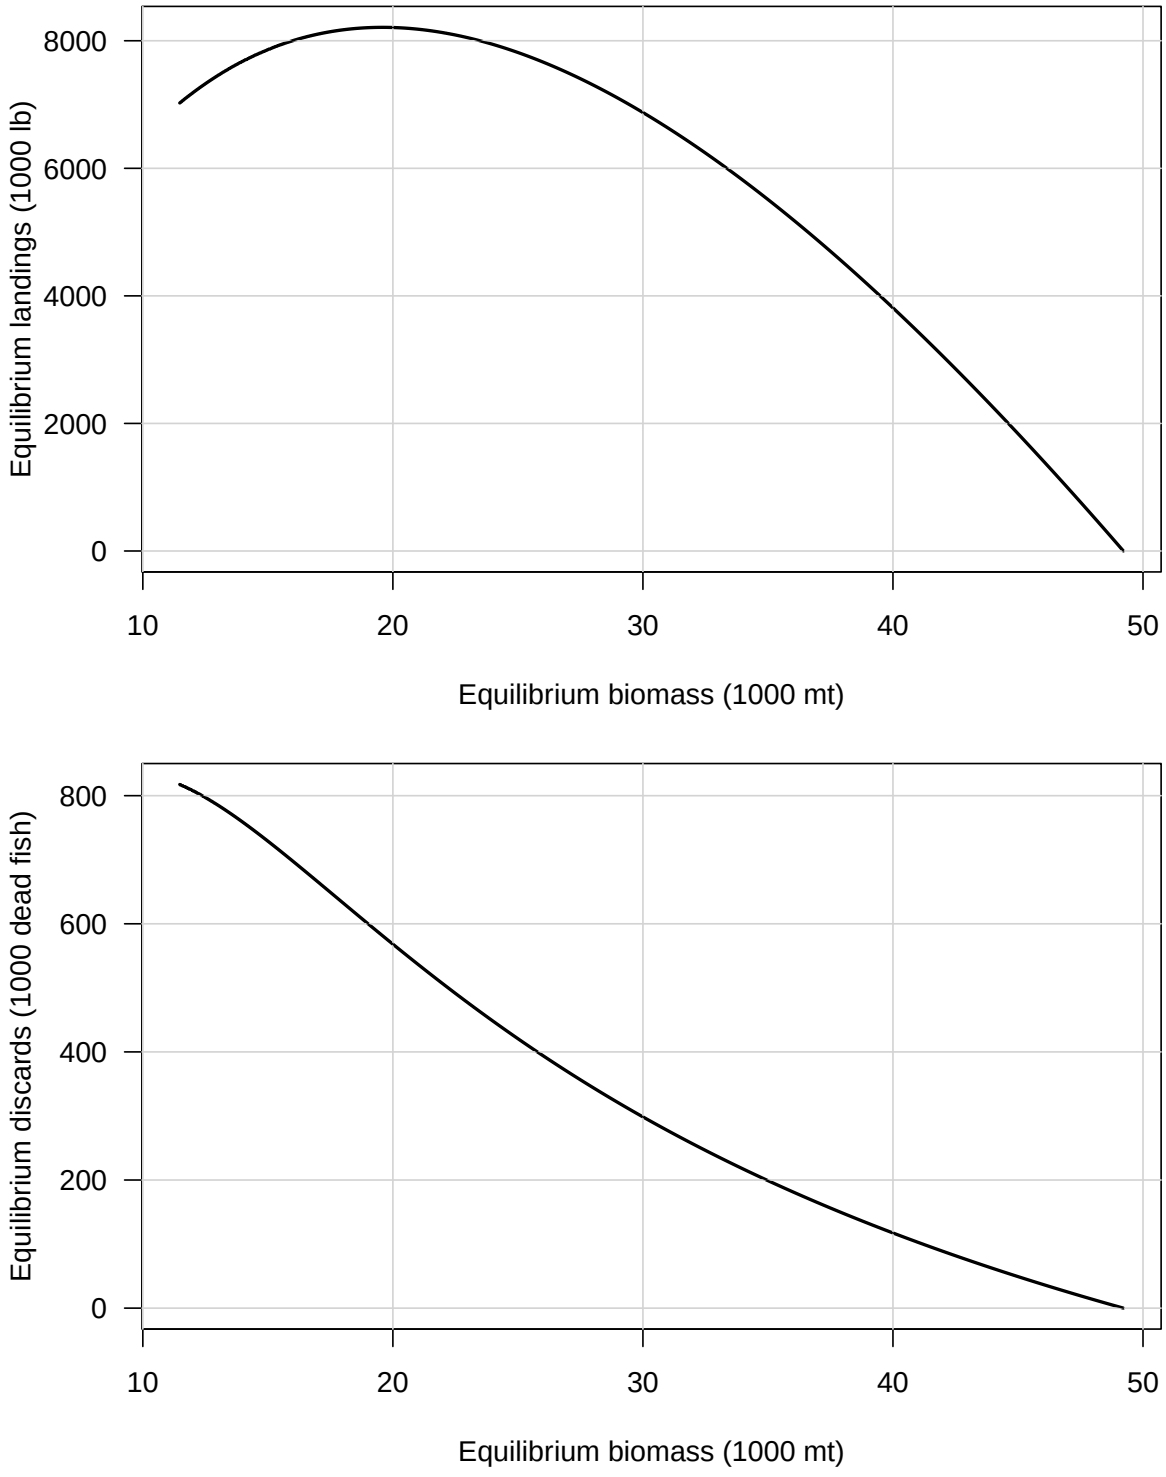

Figure 36. Probability densities of F_{MSY}-related benchmarks from MCB analysis of the Beaufort Assessment Model. Solid vertical line represent point estimates from the base run and the dashed vertical line represent the median of the MCB distribution.

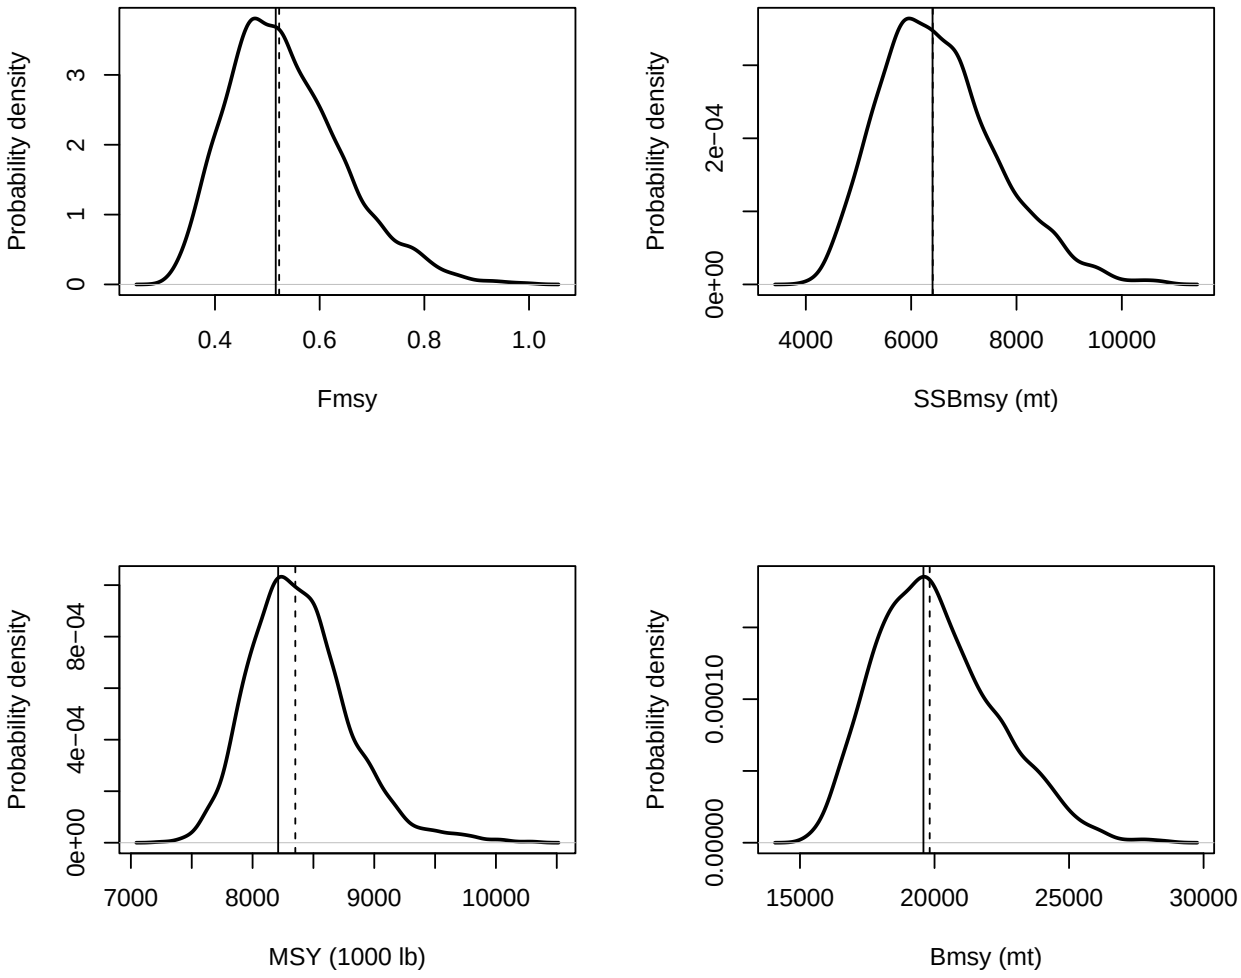

Figure 37. Estimated time series relative to benchmarks. Solid line indicates estimates from base run of the Beaufort Assessment Model; dashed lines indicate the median of the MCB trials; gray error bands indicate 5^{th} *and* 95^{th} *percentiles of the MCB trials. Top panel: spawning biomass relative to the spawning stock biomass at* MSY*. Bottom panel: F relative to* F_{MSY}*.*

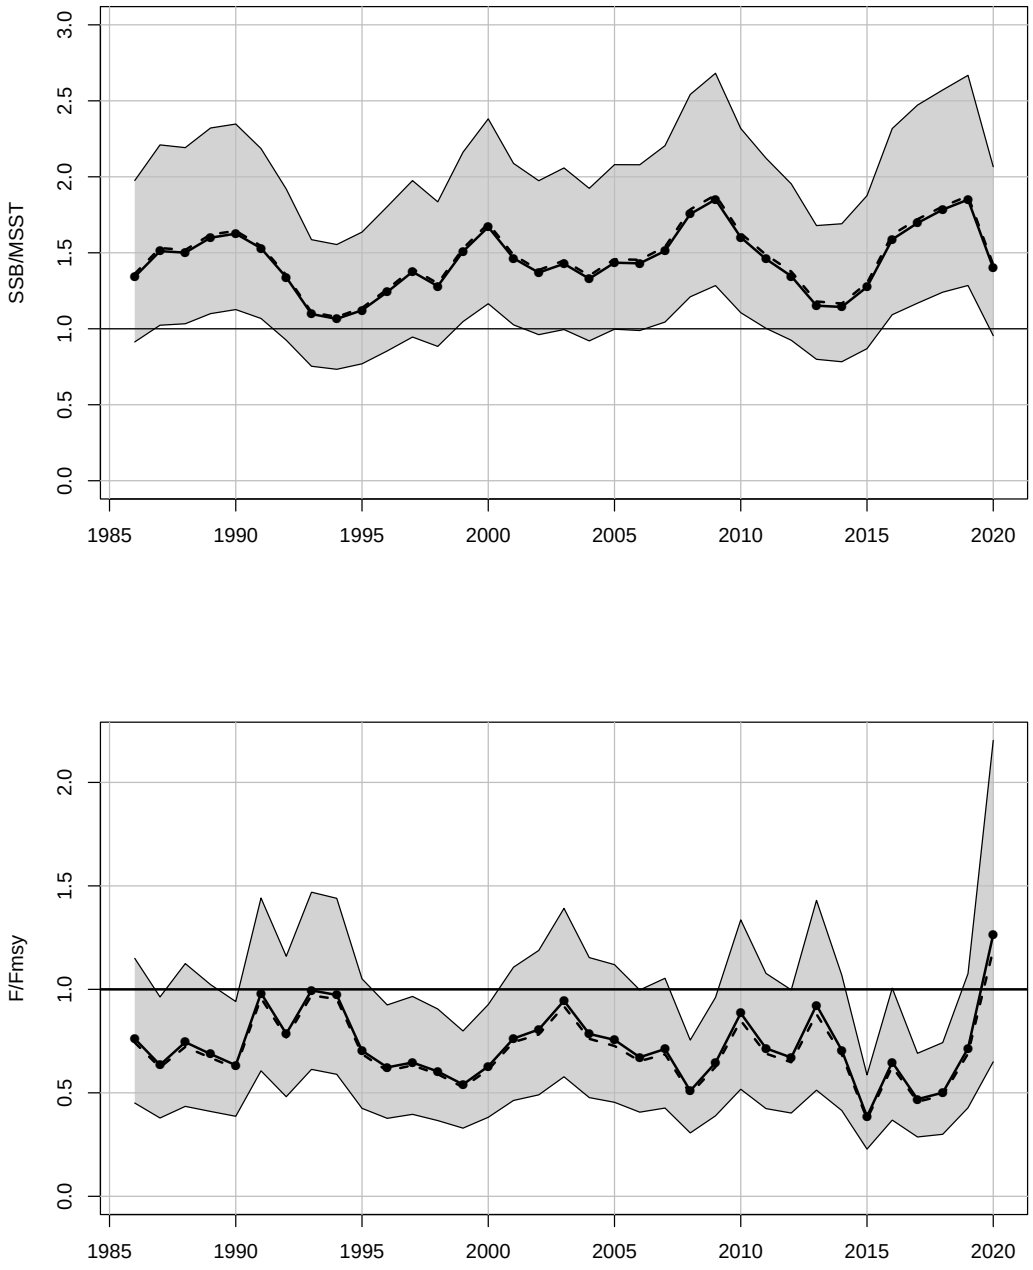

Figure 38. Phase plot of terminal status estimates from MCB analysis of the Beaufort Assessment Model. The intersection of crosshairs indicates estimates from the base run; lengths of crosshairs defined by 5^{th} and 95^{th} percentiles.

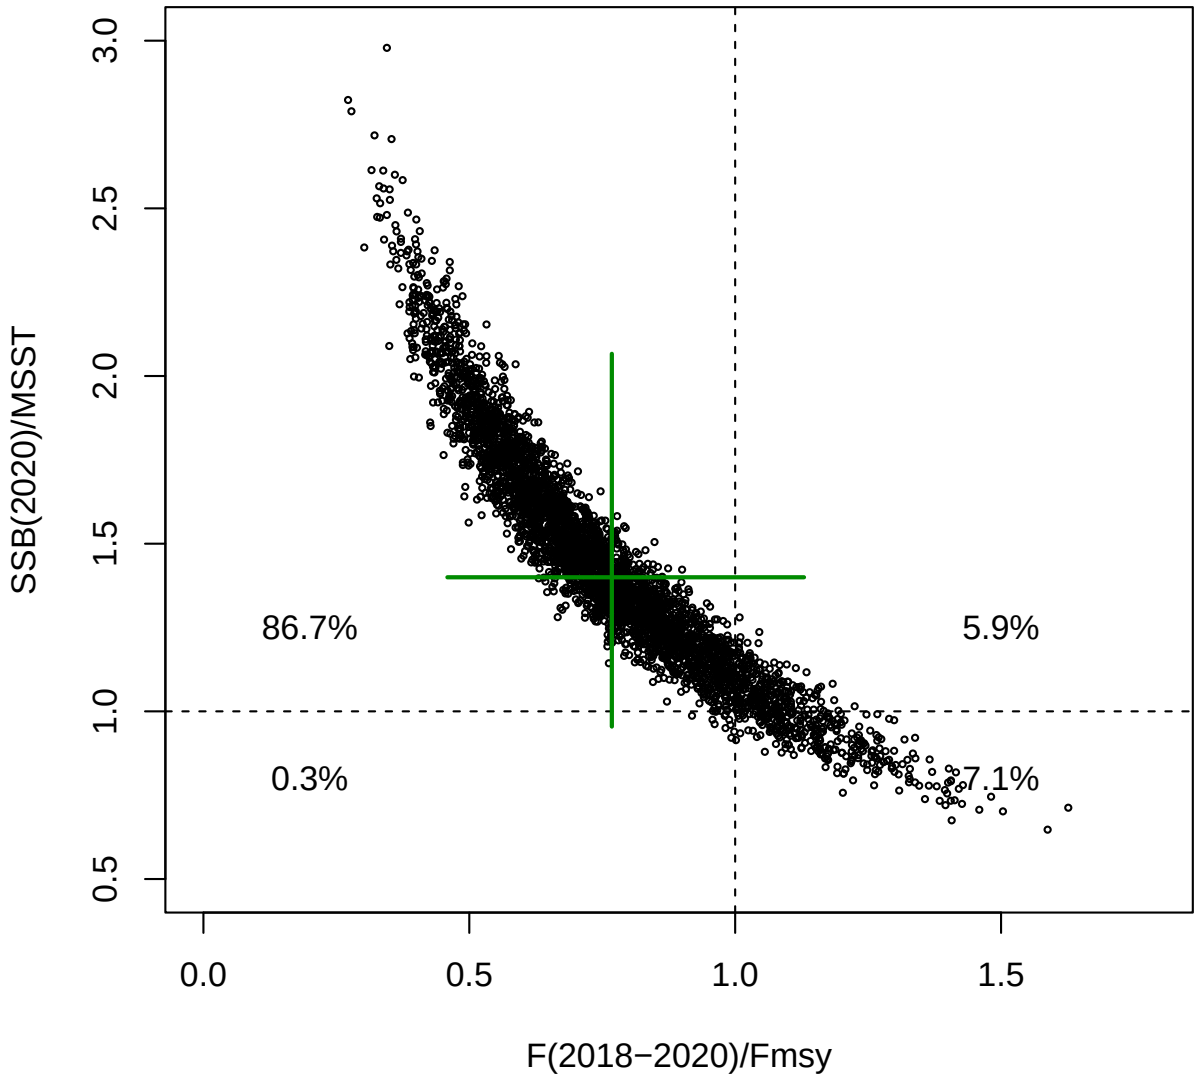

Figure 39. Phase plot of terminal status estimates from MCB analysis of the Beaufort Assessment Model. The intersection of crosshairs indicates estimates from the base run; lengths of crosshairs defined by 5^{th} and 95^{th} percentiles.

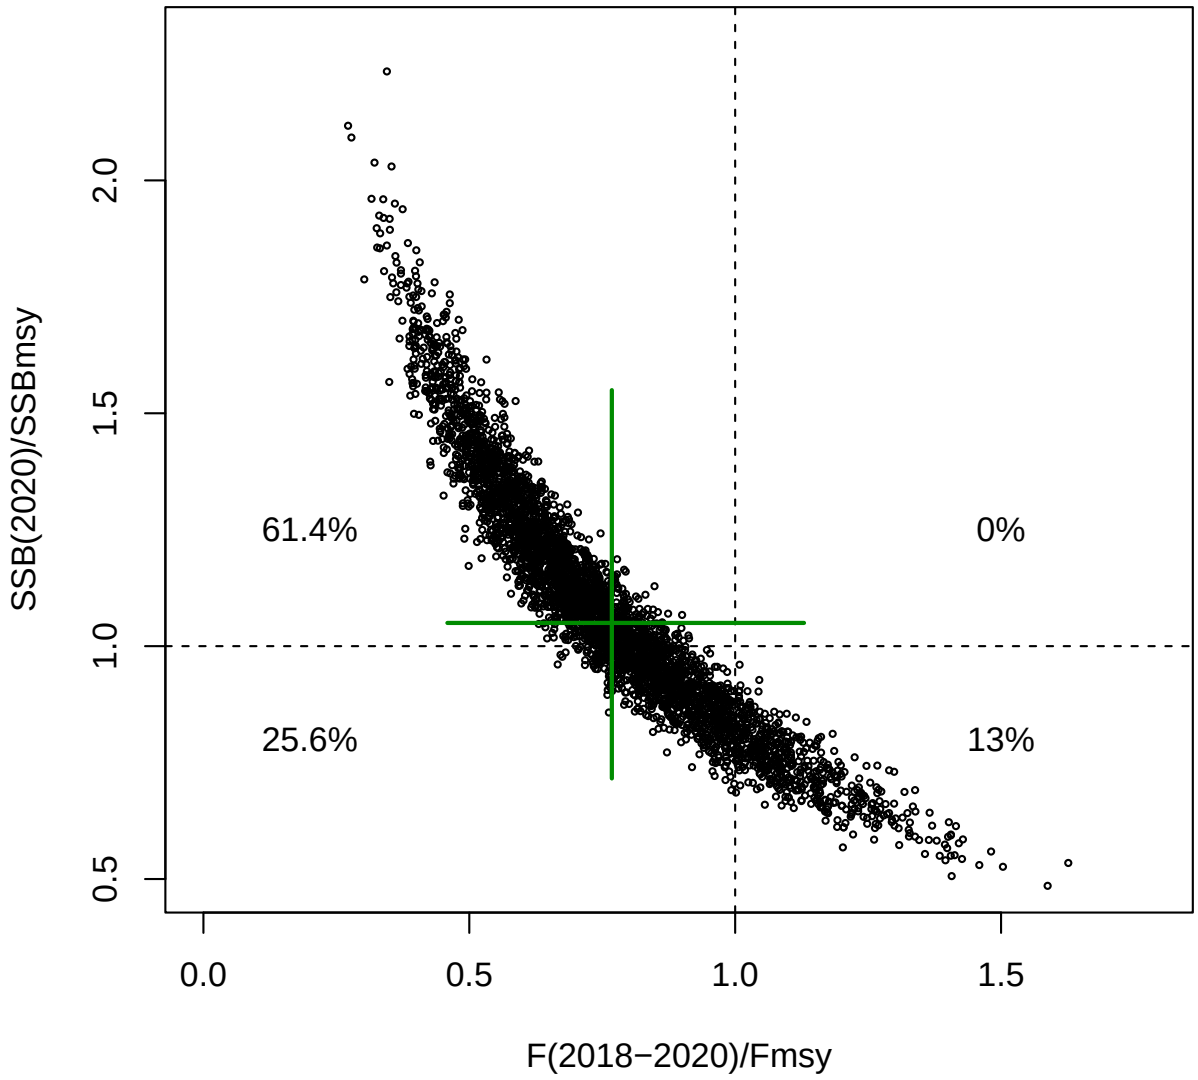

Figure 40. Probability densities of terminal status estimates from MCB analysis of the Beaufort Assessment Model. Solid vertical lines represent point estimates from the base run and dashed vertical lines indicated the median of MCB trials.

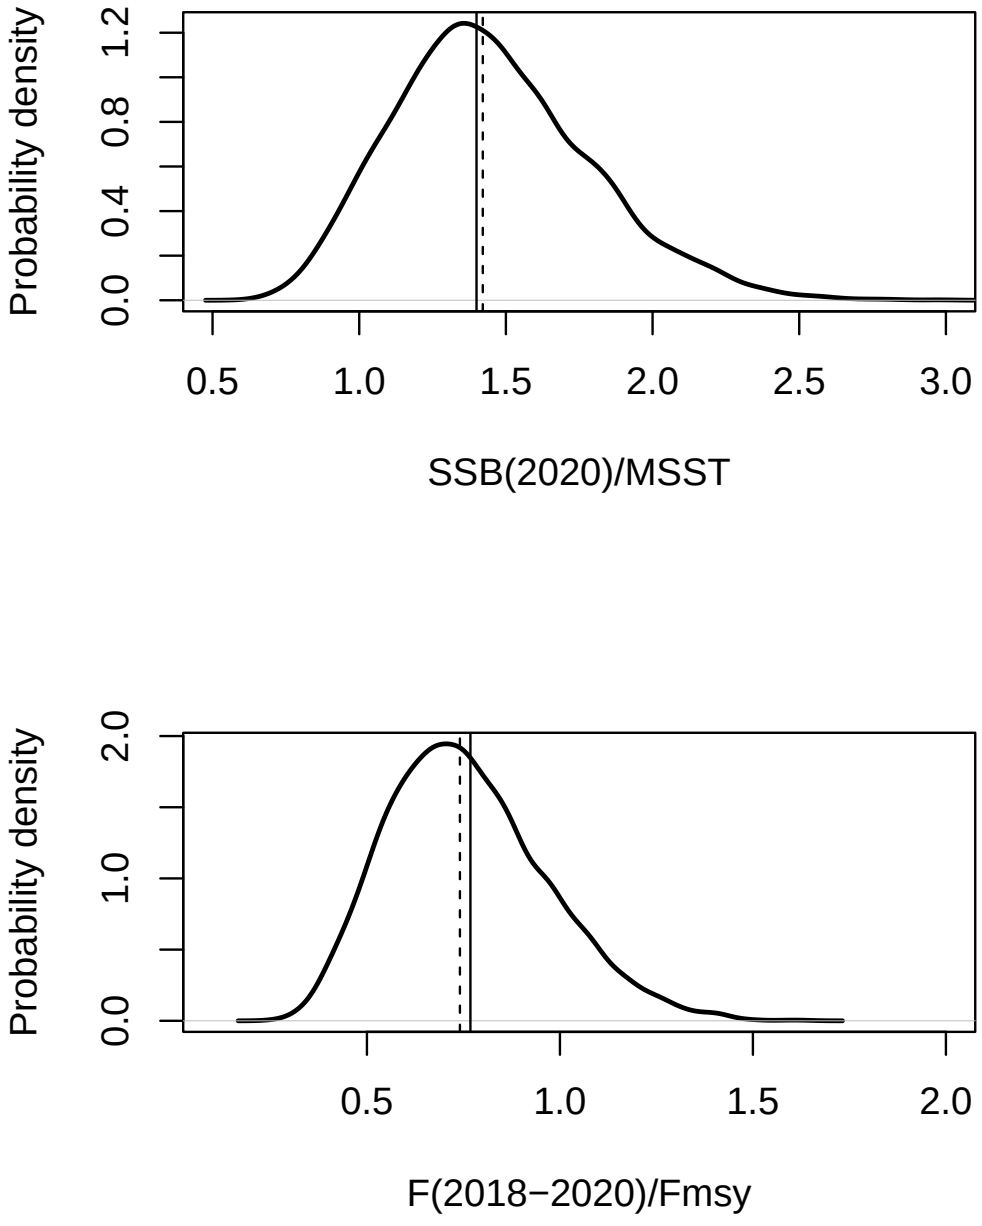

Figure 41. Comparison between SEDAR-28 and SEDAR-78 status indicators. Top panel: Apical F relative to F_{MSY}. *Bottom panel: spawning biomass relative to* MSST.

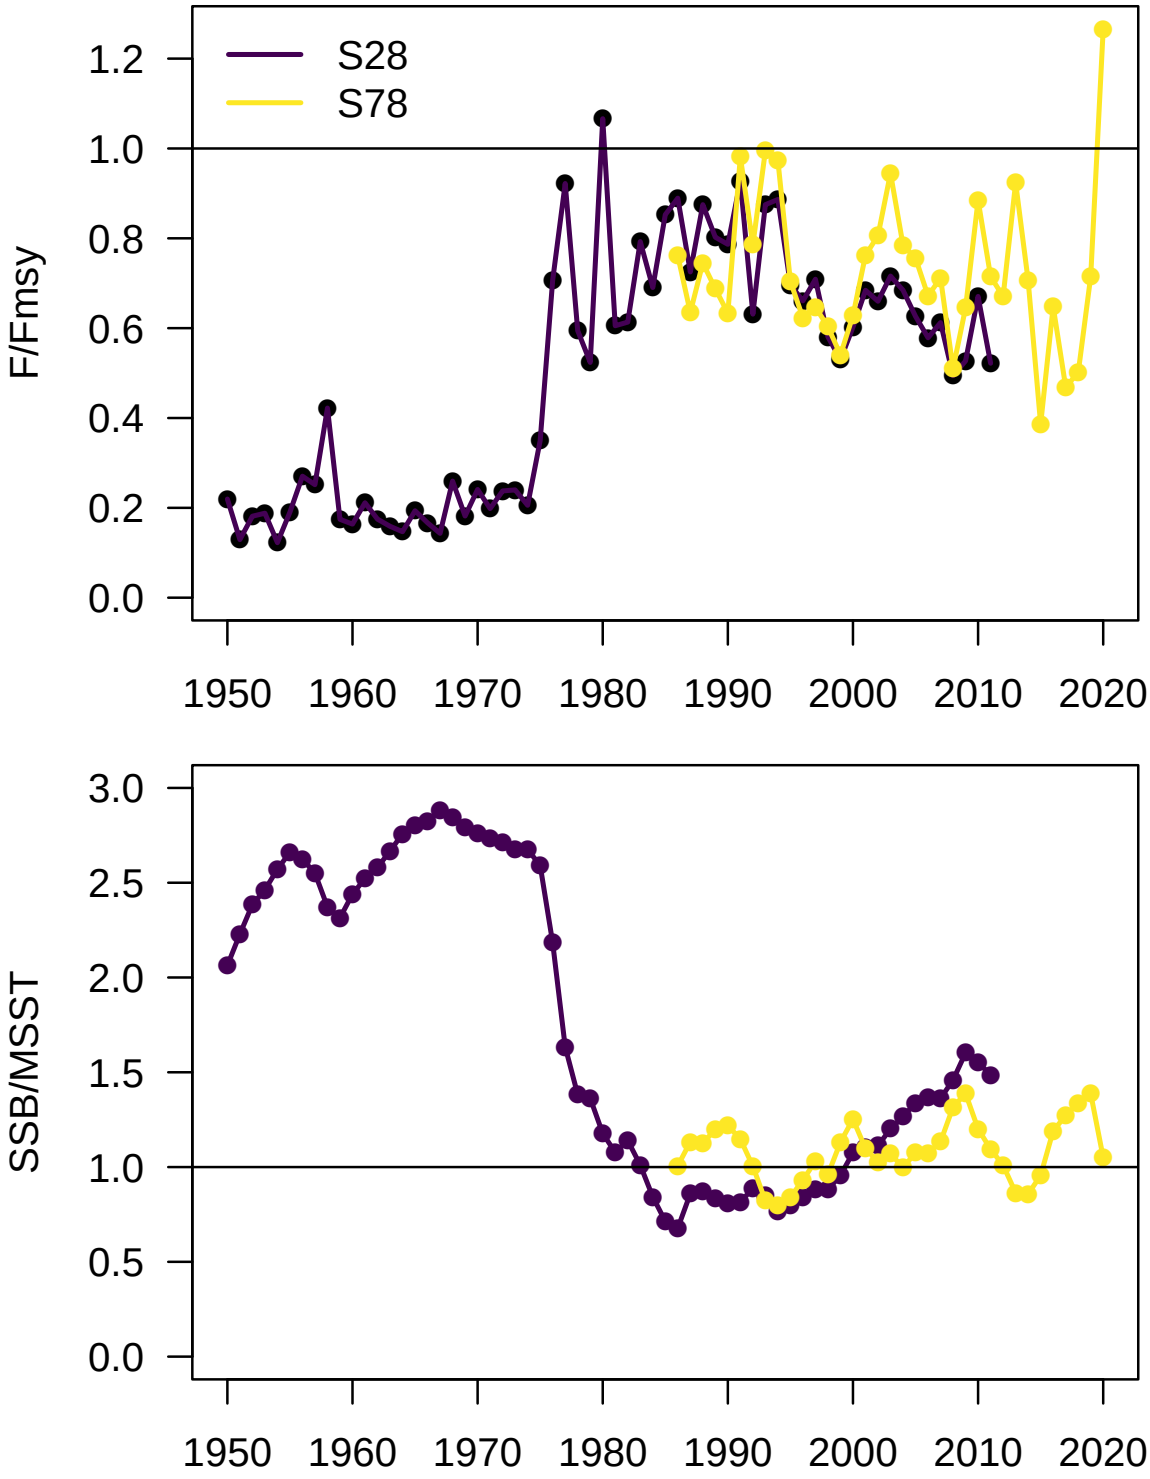

Figure 42. Spanish mackerel: Sensitivity of results to dropping the commercial handline (cH) index. (sensitivity run S1). Top panel – Ratio of F to F_{MSY}. Bottom panel – Ratio of SSB *to* SSB_{MSY}.

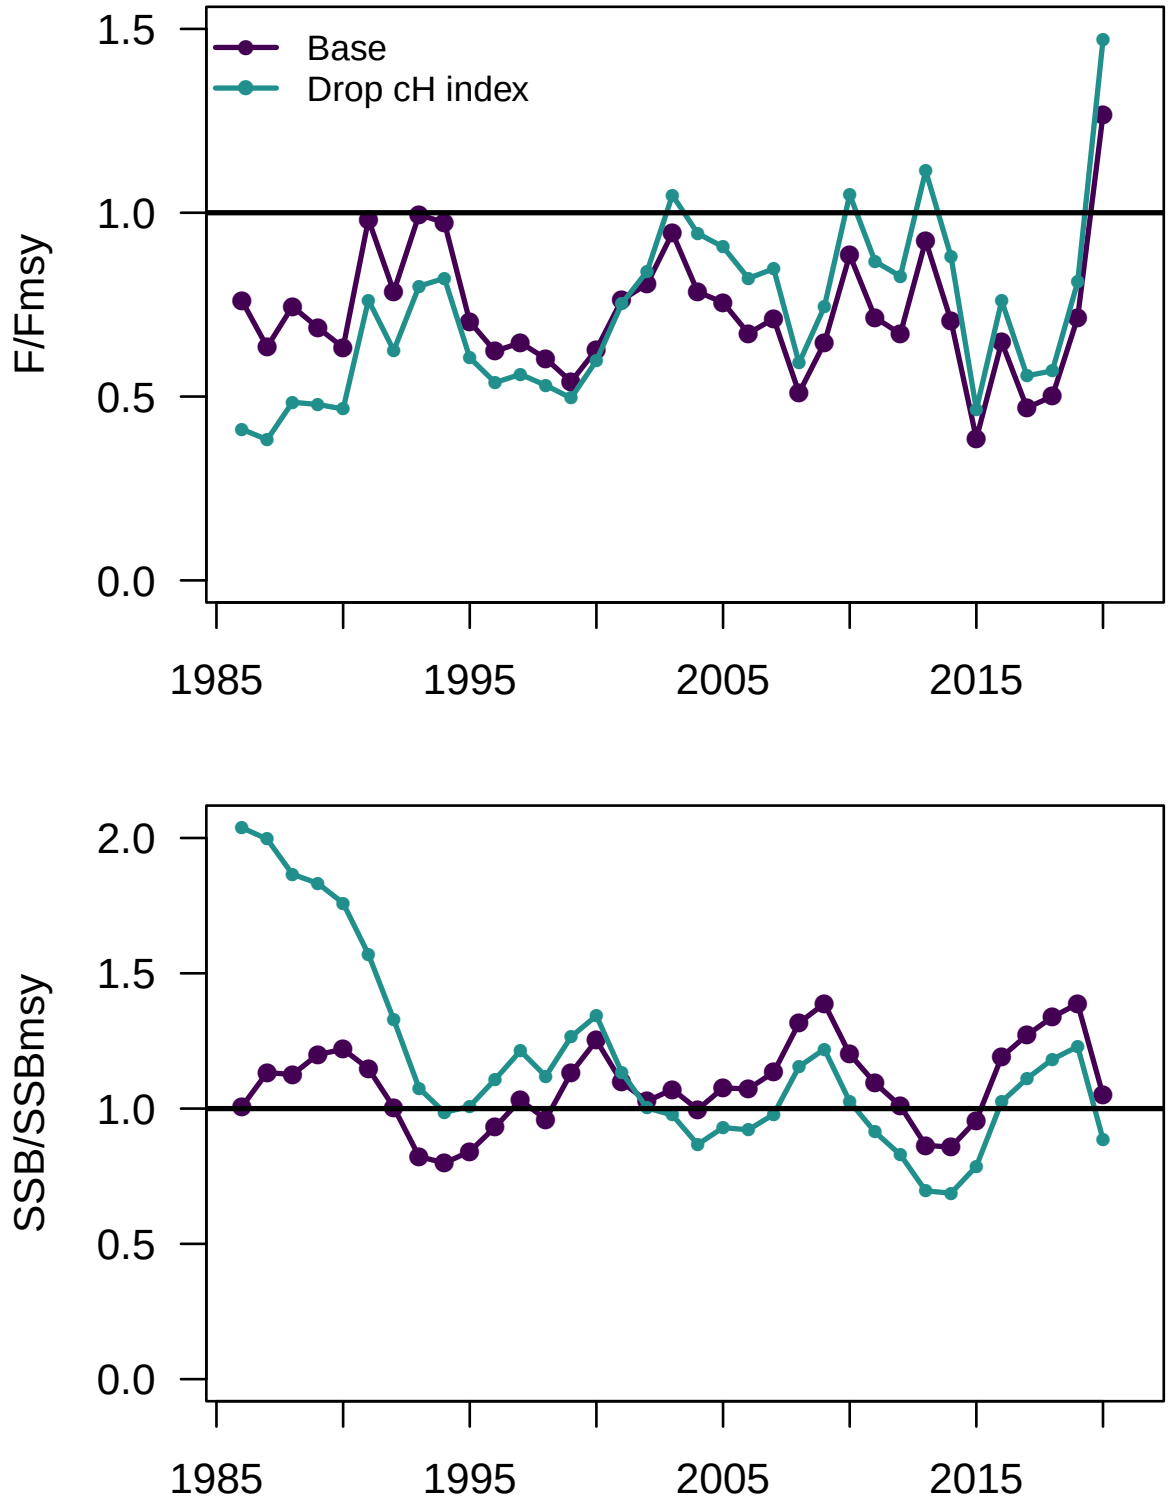

Figure 43. Spanish mackerel: Sensitivity of results to estimates of natural mortality M. (sensitivity runs S2 and S3). Top panel – Ratio of F to F_{MSY}. Bottom panel – Ratio of SSB *to* SSB_{MSY}.

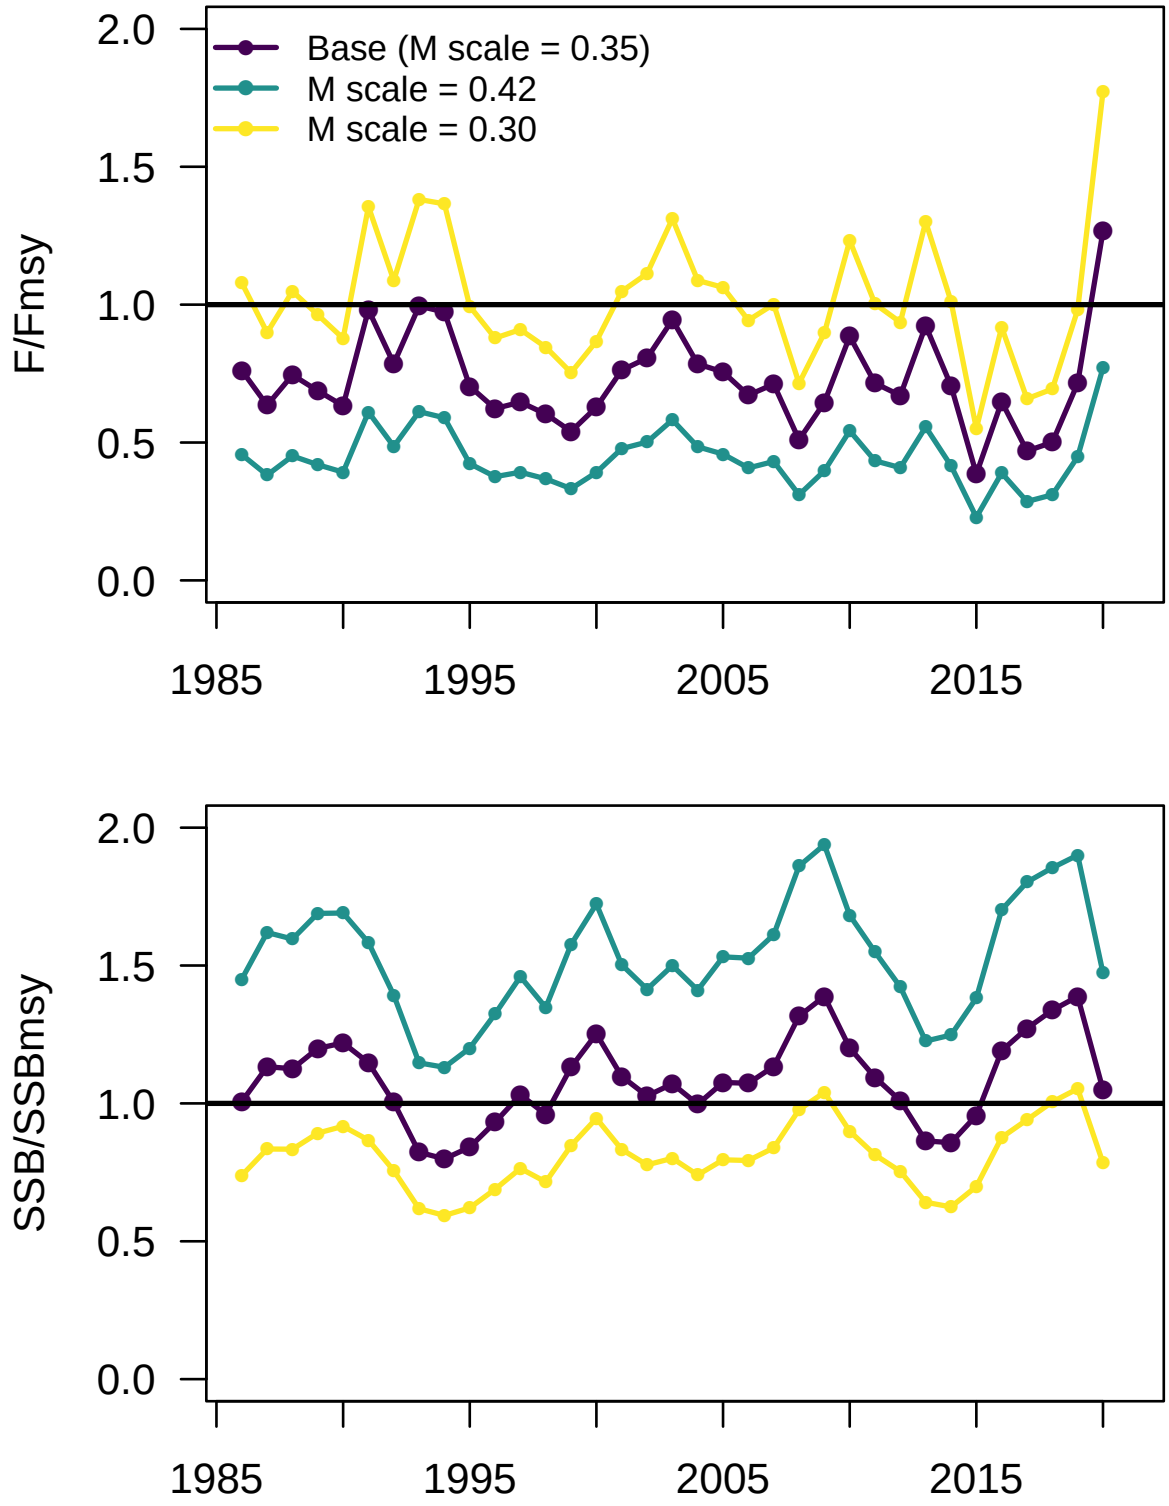

Figure 44. Spanish mackerel: Sensitivity of results to fixed values of steepness (sensitivity runs S4 and S5). Top panel – Ratio of F to F_{MSY}. Bottom panel – Ratio of SSB *to* SSB_{MSY}.

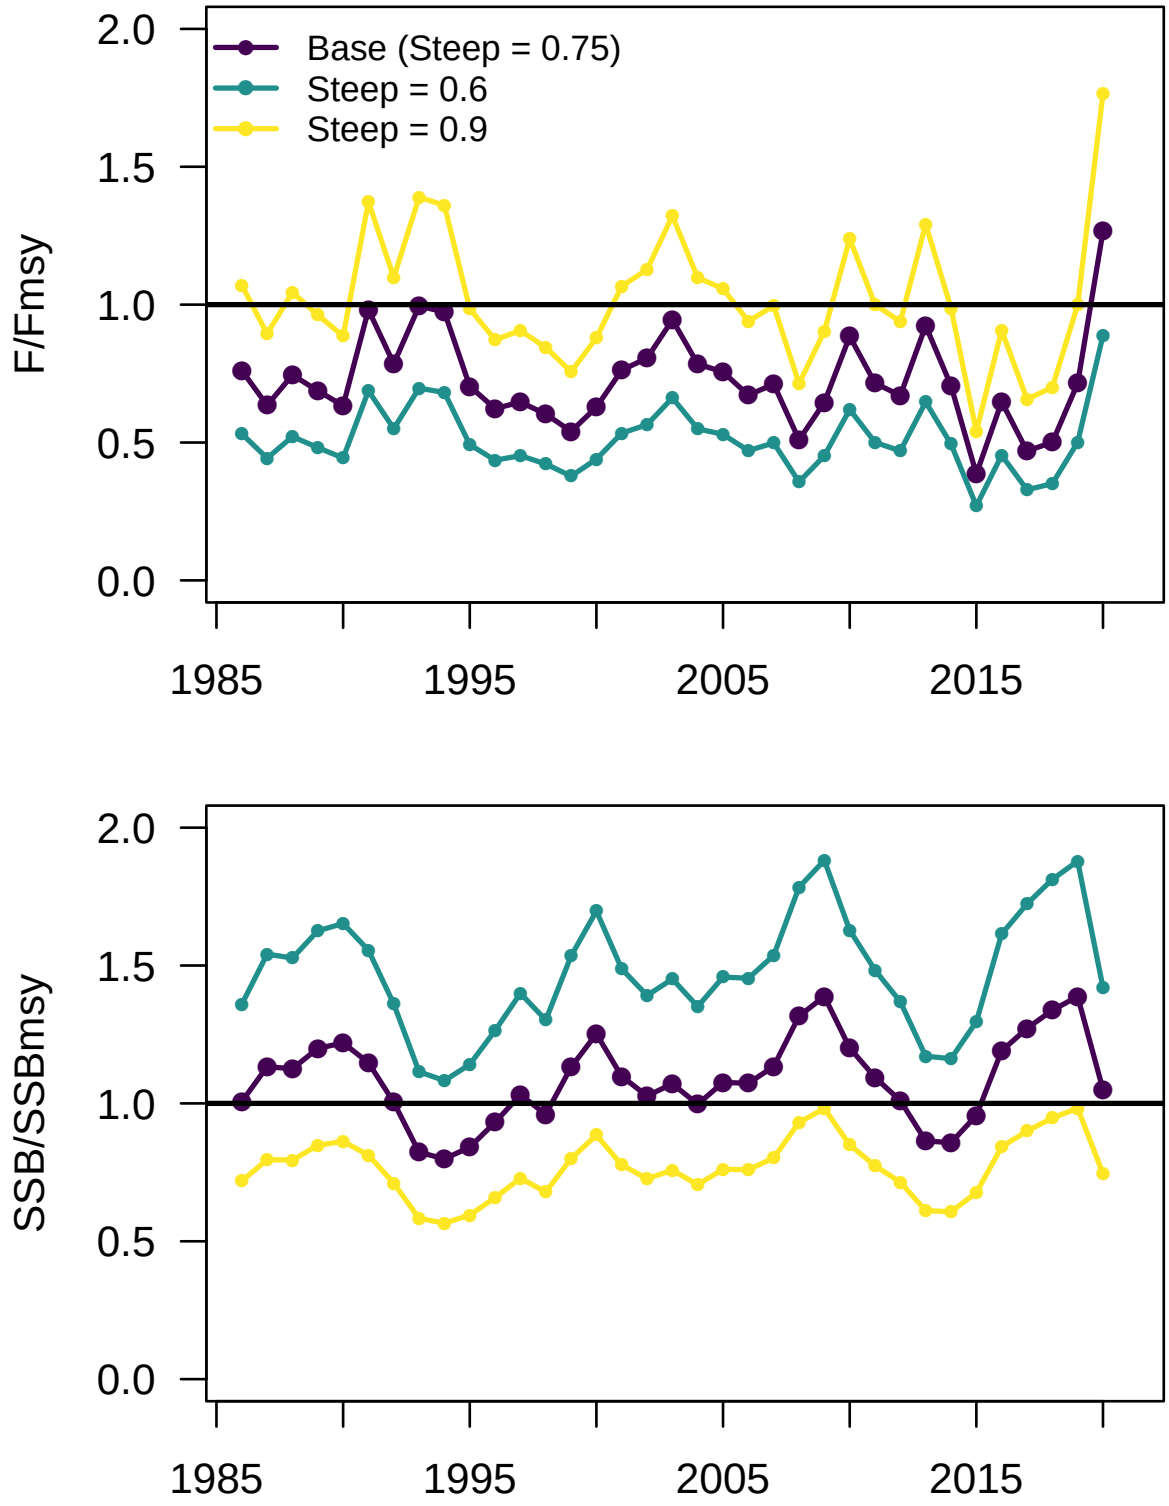

Figure 45. Spanish mackerel: Sensitivity of results to fixed values of general recreational (GR) discard mortality rate. (sensitivity runs S6 and S7). Top panel – Ratio of F to F_{MSY}. Bottom panel – Ratio of SSB *to* SSB_{MSY}.

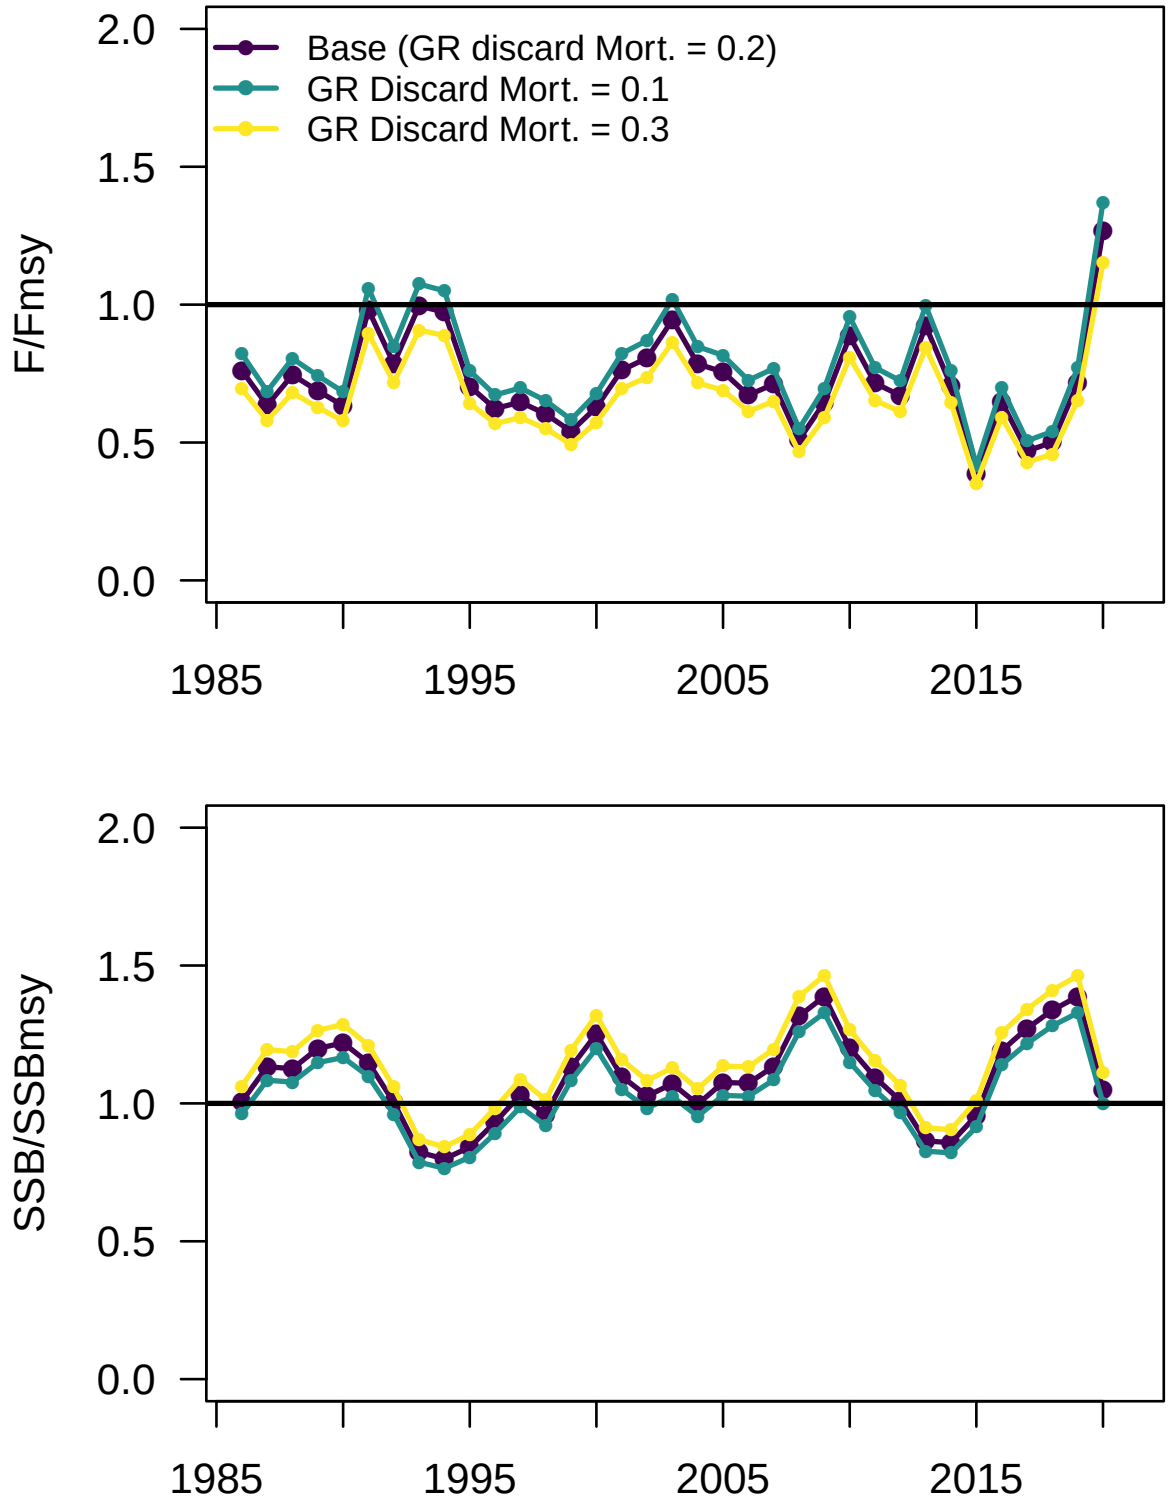

Figure 46. Retrospective analyses. Sensitivity to terminal year of data (sensitivity runs Retro 1–5). Top Panel: Fishing mortality rate, where solid circles show geometric mean of terminal three years, as used to compute fishing status. Middle Panel: Recruitment time series. Bottom Panel: Spawning stock biomass time series.

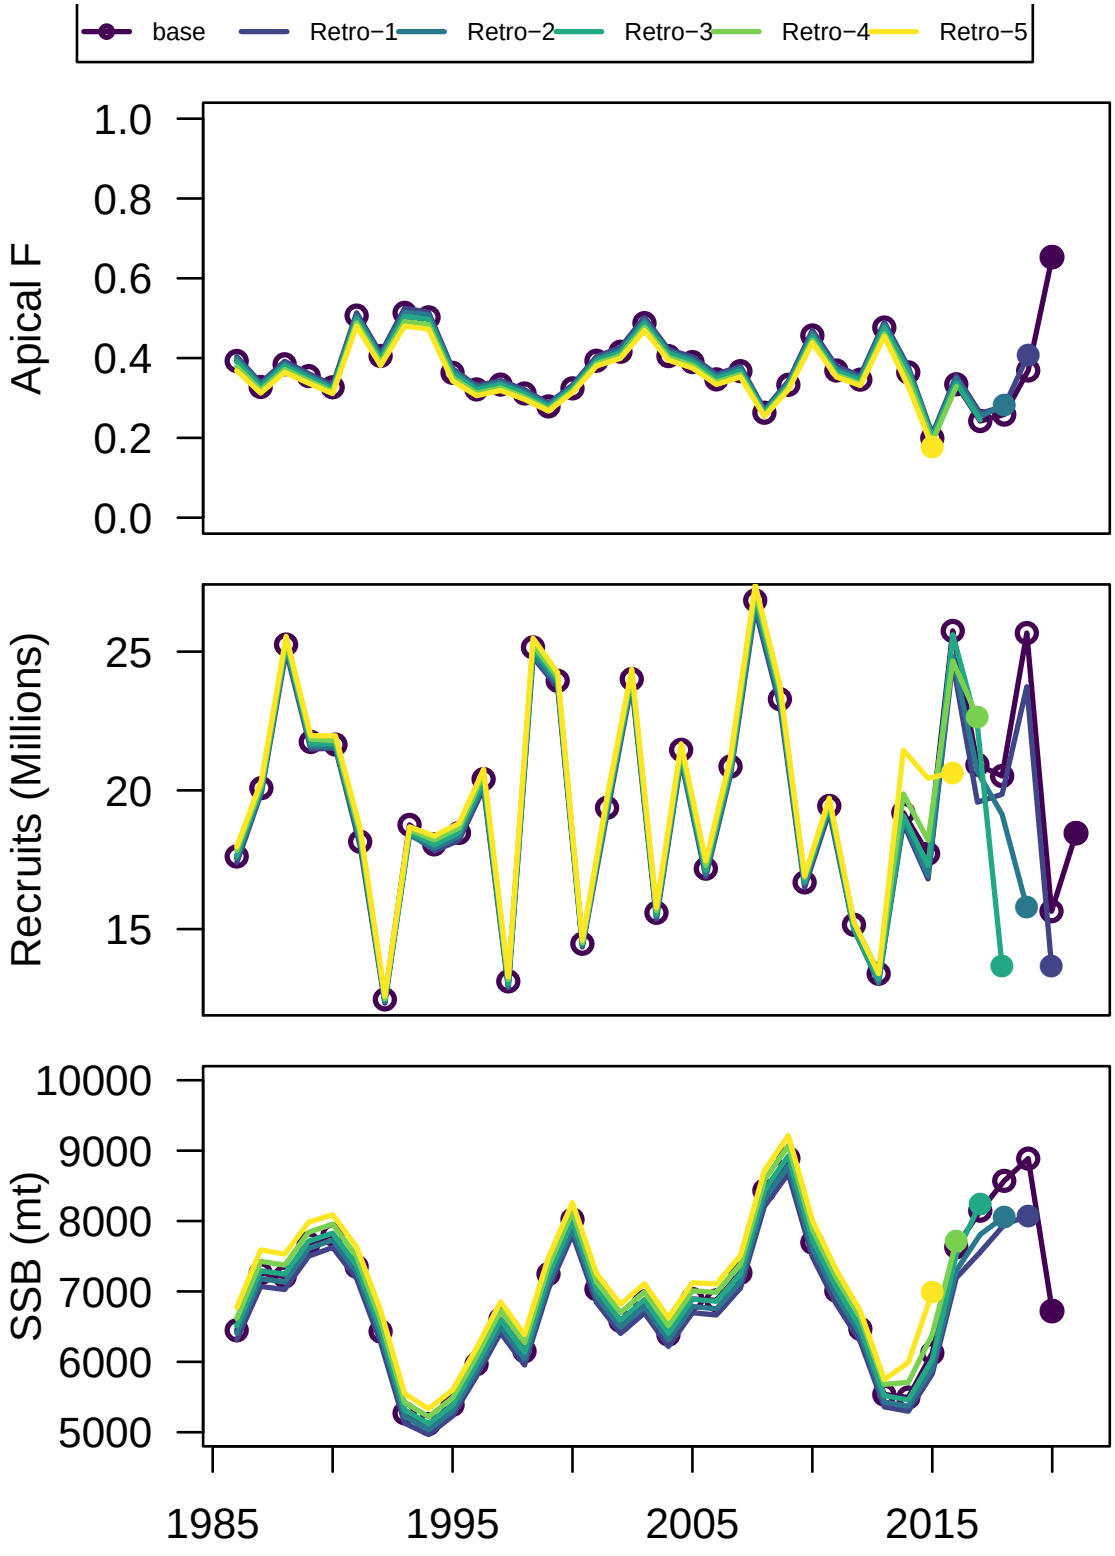

Figure 47. Retrospective analyses. Sensitivity to terminal year of data (sensitivity runs Retro 1–5). Top panel:Relative fishing mortality rate time series. Bottom panel: Relative spawning stock biomass time series.

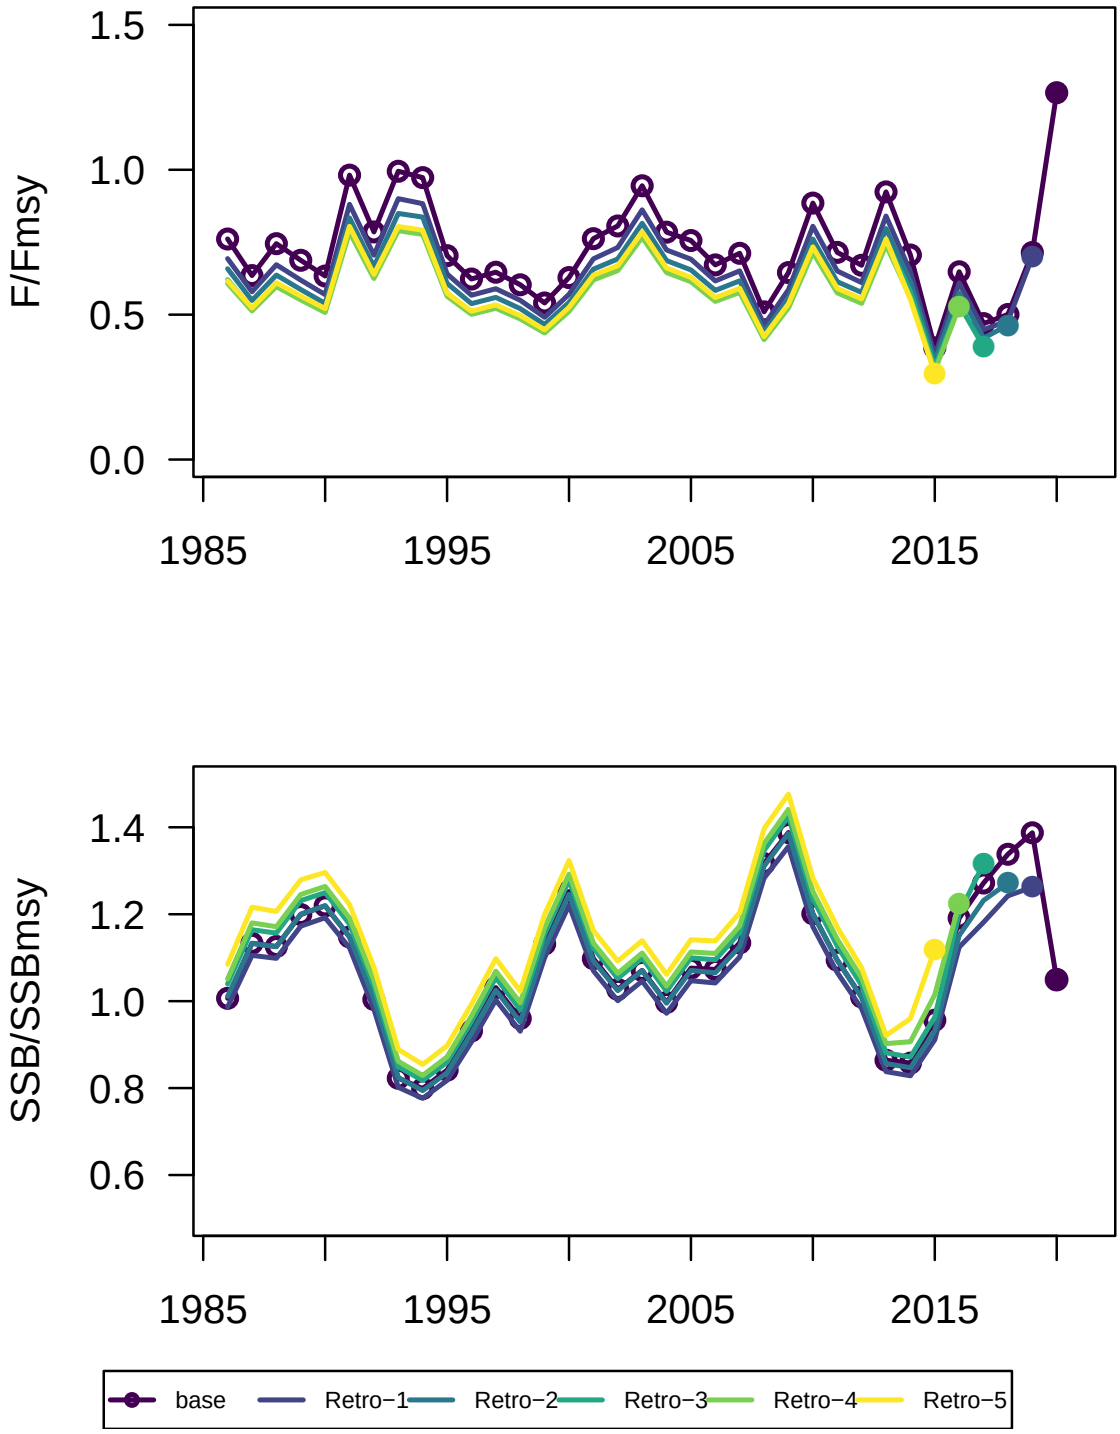

Figure 48. Projection results under scenario 1— $F = F_{\text{current}}$. Interim years (2021-2022) assume current landings based on average of the last 3 years of the assessment. Expected values (base run) represented by solid lines with solid circles, medians represented dashed lines with open circles, and uncertainty represented by thin lines corresponding to 5^{th} and 95^{th} percentiles of replicate projections. Horizontal lines mark MSY*-related quantities. Spawning stock (SSB) is at time of peak spawning.*

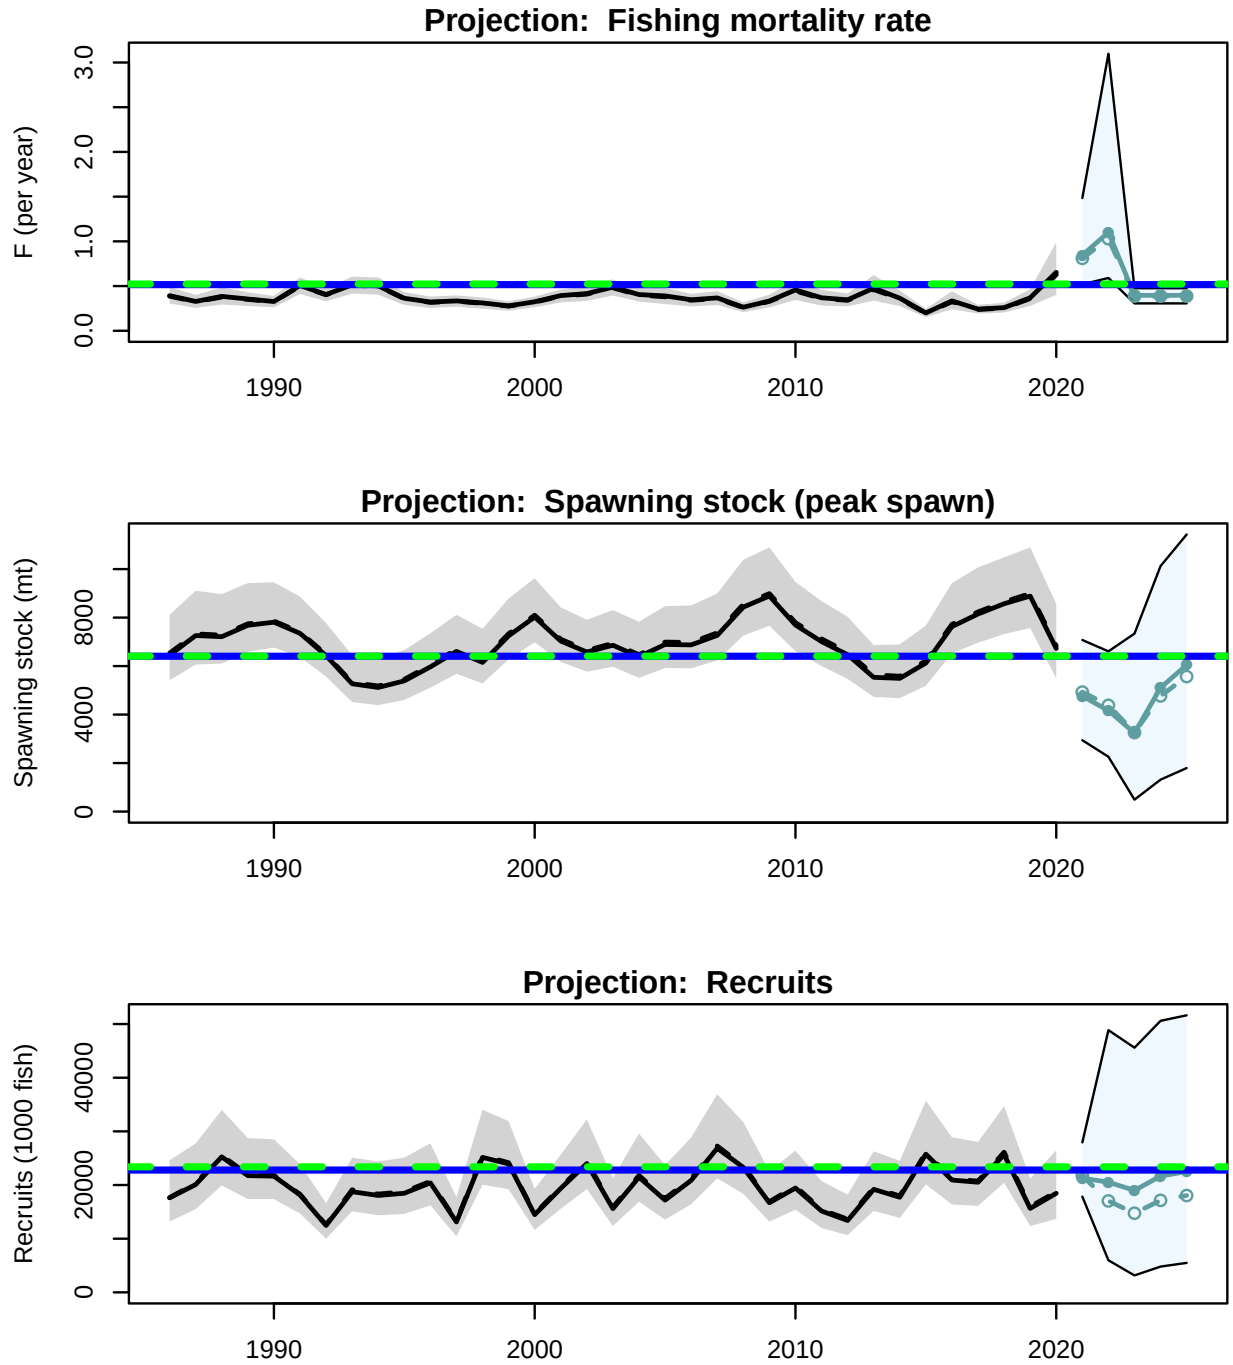

Figure 49. Projection results under scenario 2—fishing mortality rate fixed at $F = F_{\mathrm{MSY}}$. Interim years (2021-2022) assume current landings based on average of the last 3 years of the assessment. Expected values (base run) represented by solid lines with solid circles, medians represented dashed lines with open circles, and uncertainty represented by thin lines corresponding to 5^{th} and 95^{th} percentiles of replicate projections. Horizontal lines mark MSY*-related quantities. Spawning stock (SSB) is at time of peak spawning.*

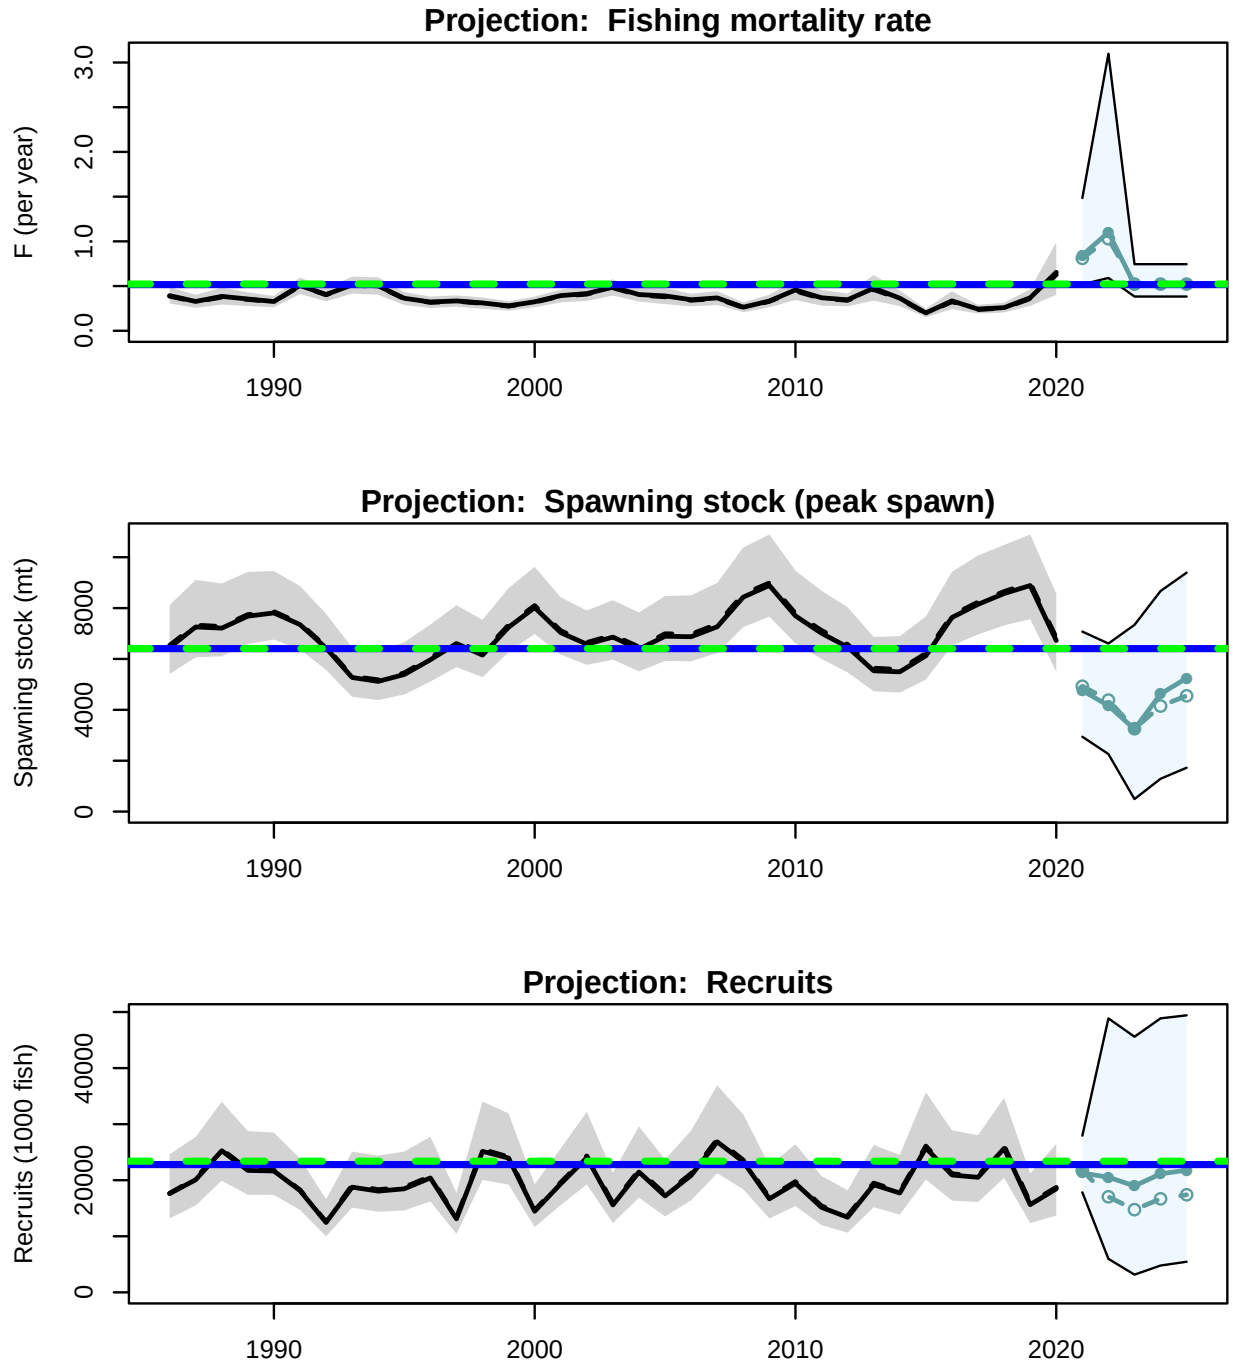

Figure 50. Projection results under scenario 3—fishing mortality rate fixed at $F = 75\%F_{\text{MSY}}$. Interim years (2021-2022) assume current landings based on average of the last 3 years of the assessment. Expected values (base run) represented by solid lines with solid circles, medians represented dashed lines with open circles, and uncertainty represented by thin lines corresponding to 5^{th} and 95^{th} percentiles of replicate projections. Horizontal lines mark MSY*-related quantities. Spawning stock (SSB) is at time of peak spawning.*

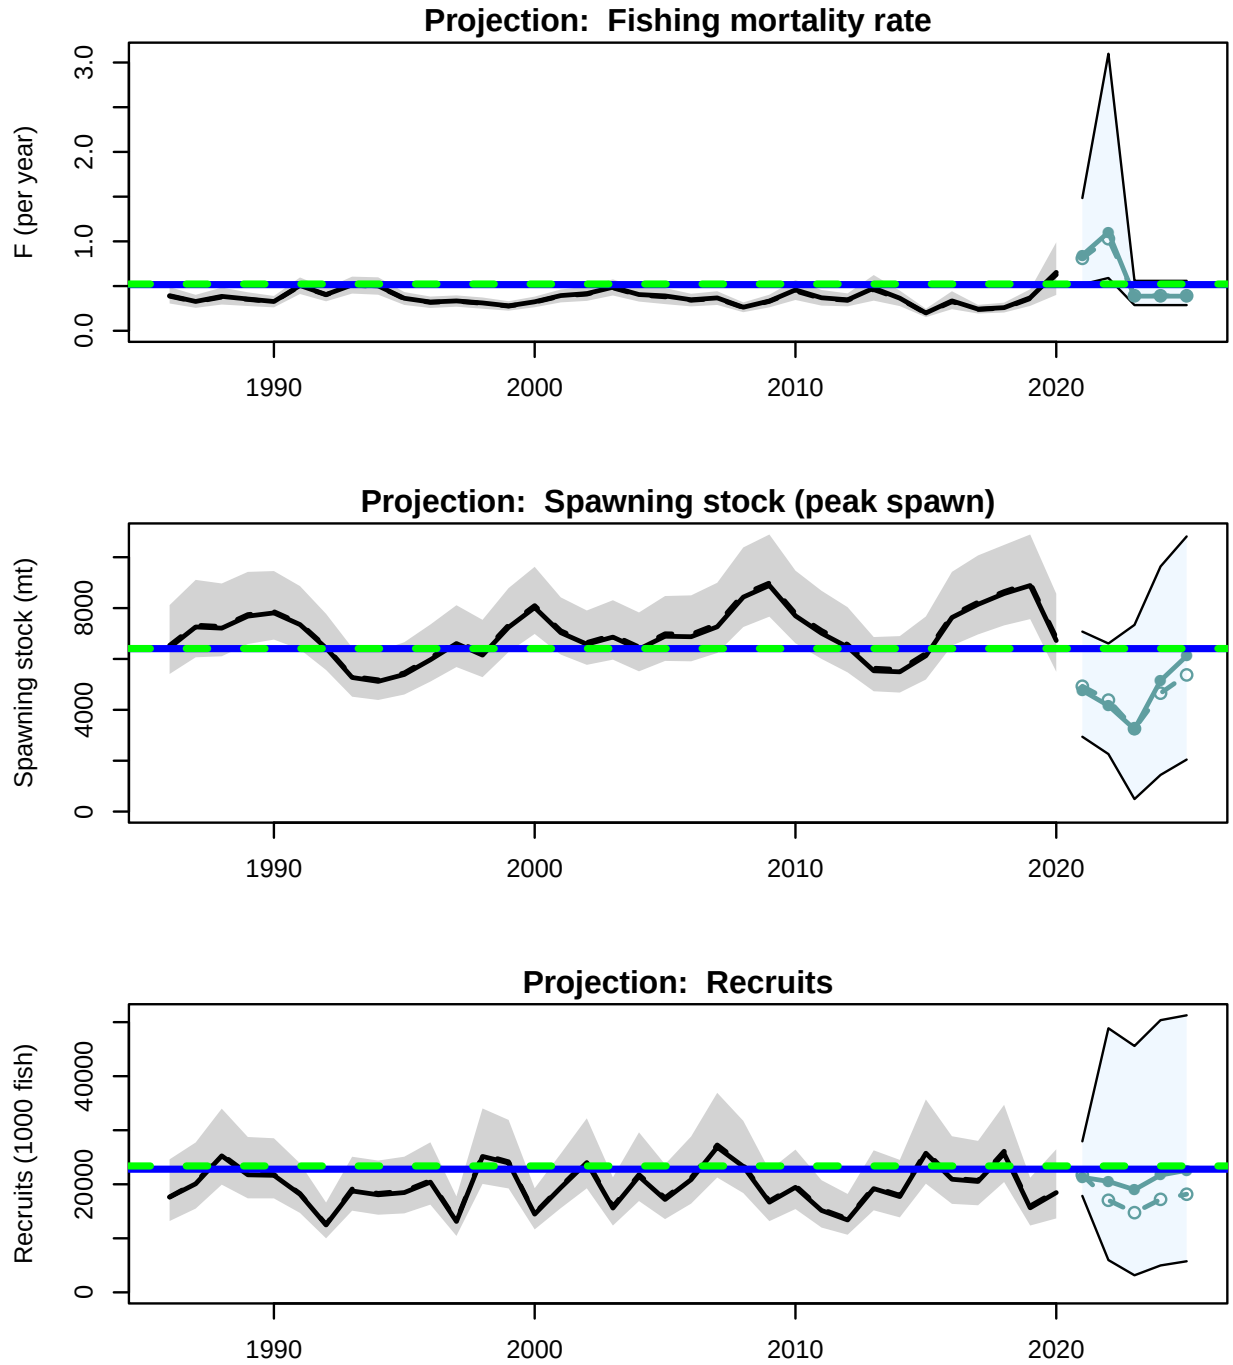

Appendix A Abbreviations and symbols

Table 27. Acronyms and abbreviations used in this report

Symbol	Meaning
ABC	Acceptable Biological Catch
AW	Assessment Workshop (here, for Spanish mackerel)
ASY	Average Sustainable Yield
B	Total biomass of stock, conventionally on January 1r
BAM	Beaufort Assessment Model (a statistical catch-age formulation)
cC	Commercial cast net fleet
cG	Commercial gillnet fleet
cH	Commercial handline fleet
cP	Commercial pound net fleet
CPUE	Catch per unit effort; used after adjustment as an index of abundance
CV	Coefficient of variation
DW	Data Workshop (here, for Spanish mackerel)
F	Instantaneous rate of fishing mortality
F_{MSY}	Fishing mortality rate at which MSY can be attained
FL	Fork length
GLM	Generalized linear model
GR	General recreational fleet (all MRIP modes and headboat)
K	Average size of stock when not exploited by man; carrying capacity
kg	Kilogram(s); 1 kg is about 2.2 lb.
klb	Thousand pounds; thousands of pounds
lb	Pound(s); 1 lb is about 0.454 kg
m	Meter(s); 1 m is about 3.28 feet.
M	Instantaneous rate of natural (non-fishing) mortality
MCBE	Monte Carlo/Boostrap Ensemble, an approach to quantifying uncertainty in model results
MFMT	Maximum fishing-mortality threshold; a limit reference point used in U.S. fishery management; often based on F_{MSY}
mm	Millimeter(s); 1 inch = 25.4 mm
MRFSS	Marine Recreational Fisheries Statistics Survey, a data-collection program of NMFS, predecessor of MRIP
MRIP	Marine Recreational Information Program, a data-collection program of NMFS, descended from MRFSS
MSST	Minimum stock-size threshold; a limit reference point used in U.S. fishery management. The SAFMC has defined MSST for Spanish mackerel as $75\%\mathrm{SSB}_{\mathrm{MSY}}$.
MSY	Maximum sustainable yield (per year)
mt	Metric ton(s). One mt is 1000 kg, or about 2205 lb.
N	Number of fish in a stock, conventionally on January 1
NC	State of North Carolina
NMFS	National Marine Fisheries Service, same as "NOAA Fisheries Service"
NOAA	National Oceanic and Atmospheric Administration; parent agency of NMFS
OY	Optimum yield; SFA specifies that OY $\leq$ MSY.
PSE	Proportional standard error
R	Recruitment
SAFMC	South Atlantic Fishery Management Council (also, Council)
SC	State of South Carolina
SCDNR	Department of Natural Resources of SC
SDNR	Standard deviation of normalized residuals
SEDAR	SouthEast Data Assessment and Review process
SFA	Sustainable Fisheries Act; the Magnuson–Stevens Act, as amended
SL	Standard length (of a fish)
SPR	Spawning potential ratio
SSB	Spawning stock biomass; mature biomass of males and females
$\mathrm{SSB}_{\mathrm{MSY}}$	Level of SSB at which MSY can be attained
TIP	Trip Interview Program, a fishery-dependent biodata collection program of NMFS
TL	Total length (of a fish), as opposed to FL (fork length) or SL (standard length)
VPA	Virtual population analysis, an age-structured assessment
WW	Whole weight, as opposed to GW (gutted weight)
YOY	Young of the year index developed from SEAMAP Coastal Trawl Survey
yr	Year(s)

Appendix B Parameter estimates from the Beaufort Assessment Model

TABLES

DOCUMENTS

* Indicates documents not available for the Briefing Book. These will be distributed as they become available and added to Recent Documents section of the webpage.

SAFMC PUBLIC COMMENT PROCESS

Written comment:

Written comment on SSC agenda topics is provided to the Committee through an online form, similar to all other Council briefing materials. Written comment can be submitted at this link. For this meeting, the deadline for submission of written comment is 9:00 a.m. August 4, 2022.

Verbal comment:

Two opportunities for comment on agenda items will be provided at set times during SSC meetings. The first will be at the beginning of the meeting, and the second near the conclusion. Those wishing to comment should indicate such in the manner requested by the Chair, who will then recognize individuals to provide comment.

An opportunity for comment on specific agenda items will also be provided as each item comes up for discussion. Comments will be taken after all the initial presentations are given and before the SSC starts the discussion of the agenda topic. As before, those wishing to comment should indicate such in the manner requested by the Chair, who will then recognize individuals to provide comment. All comments are part of the record of the meeting.

Meeting Format:

This meeting will be held as a webinar on August 4, 2022. Registration for the meeting can be found at the Council's website: https://safmc.net/scientific-and-statistical-committee-meeting/

1. JOINT SSC INTRODUCTIONS

1.1 Documents

Attachment 1: SSC August 2022 Agenda

1.2 Action

- Introductions
- Review and Approve Agenda
  - *Meeting agenda approved*
- Meeting Procedures
  - *South Atlantic is lead Council for this Joint meeting*
  - *Jeff Buckel will Chair, Fred Scharf is Vice-chair*
  - *SA operates by Consensus: no motions or voting*
  - *Use SA ABC Control Rule*

2. PUBLIC COMMENT

The public is provided this comment period for any general comments pertaining to any items on the agenda. There will also be time provided for public comment during each specific agenda item as they are discussed. Those wishing to make comment should indicate their desire to do so to the Committee Chair.

3. SOUTHEASTERN U.S. YELLOWTAIL SNAPPER INTERIM ANALYSIS

3.1 Documents

Attachment 3a: Stock Assessment Report for Yellowtail Snapper
*Attachment 3b: Presentation for Yellowtail Snapper
Attachment 3c: Terms of Reference for Yellowtail Snapper
Attachment 3d: October 2020 Joint SSC Report
Attachment 3e: South Atlantic ABC Control Rule for Yellowtail Snapper

3.2 Presentation

Shanae Allen and Chris Swanson, FWC-FWRI

3.3 Overview

An interim analysis was conducted for Yellowtail Snapper following the Benchmark SEDAR 64 (S64) stock assessment. This analysis applied updated landings and discards data for each fleet (commercial, headboat, and MRIP [a combination of charter, private, and shore modes]) to the S64 base model from 2018 – 2020. Adjusted projections of spawning stock biomass, recruitment, and retained yield to inform the Acceptable Biological Catch (ABC) and the Annual Catch Limit (ACL) account for the updated landings and discards. The interim analysis found that Yellowtail

Snapper was not overfished nor undergoing overfishing in the terminal year 2020. The MFMT (defined as $F_{30\%SPR}$) was estimated to be 0.429 yr^{-1} and $F_{current}$ was estimated to be 0.292 yr^{-1}; therefore, the F ratio ($F_{current}$ /MFMT) was equal to 0.68. The $SSB_{F30\%SPR}$ for this interim analysis was estimated at 1,915.86 metric tons (4,223,743 pounds) and the MSST (defined as $0.75*SSB_{F30\%SPR}$) was therefore defined as 1,436.90 metric tons (3,167,807 pounds). $SSB_{current}$ was estimated to be 2,810.33 metric tons (6,195,718 pounds); therefore, the SSB ratio ($SSB_{current}$/MSST) was equal to 1.47.

Previous meetings of the Joint SSCs in July and October 2020 deemed the SEDAR 64: Southeastern Yellowtail Snapper is consistent with the best scientific information available and useful for management advice. The SSCs recommended using the calculated P* value of 0.375 to produce ABCs using the South Atlantic Council's ABC Control Rule, and also recommended that the Council consider adjusting the ACL or ACT for management uncertainty (e.g., $0.75*F_{30\%SPR}$; see Attachments 3d and 3e). Due to the length of time elapsed between the terminal year and management action, this interim analysis was conducted using updated data streams to inform projections. The SSCs are asked to review the interim analysis of Southeastern U.S. Yellowtail Snapper, discuss, and provide feedback on projections and uncertainties, and make catch level recommendations.

3.4 Public Comment

3.5 Action

- **Review Interim Analysis**
  - Does the interim analysis address the TORs to the SSCs satisfaction?
    - *Yes, all TORs were addressed to the SSC's satisfaction.*
  - Are there any issues with the interim analysis that would prevent it from providing fishing level recommendations?
    - *No issues*
  - Is the Yellowtail Snapper interim analysis consistent with the best scientific information available?
    - *The Interim Analysis is consistent with BSIA as specified by the TORs for this assessment.*
    - *However, the interim analysis process has not yet been vetted by the SA-SSC. The SA-SSC is awaiting further information and evaluation to determine under what circumstances interim analyses can be considered BSIA. The GOM-SSC has apparently accepted some types of interim analyses in the past. There was some confusion in the terminology and configuration of this interim analysis when compared to an assessment. The interim analysis provided by the FWC for yellowtail snapper was different from past interim analyses provided to the GOM-SSC from the SEFSC.*
    - *Research recommendation: Compare the different types of interim analyses provided by the SEFSC and the FWC.*

Provide ToRs for the guidance of this comparison. Determine robustness of the analyses for providing catch advice.

- *Yuying Zhang offered advice on this research based on their results from a customized MSE approach that is in development*
- *Other research recommendations to be explored to address identified uncertainties for the yellowtail snapper assessment (in next FWC assessment):*
  - *Update indices (as these were not updated in this interim analysis).*
  - *Update MRIP catch per trip estimates*
  - *Re-emphasize previous research recommendations from S64 Benchmark assessment review*

➢ **Provide fishing level recommendations**

- Complete the catch level recommendations table and make recommendations for OFL and ABC.
- Comment on any difficulties encountered in applying the Control Rule, including any required information that is not available.
  - *Increased level of uncertainty surrounding the use of P* from the benchmark assessment for the interim analysis projections given the time elapsed since setting the initial P* from the benchmark assessment and the fact that the characterization of uncertainty in the projections did not account for natural mortality and discard mortality.*
  - *The SSCs had considerable discussion about reducing P* given the above considerations.*
  - *The SSCs recommend setting OFL at the yield achieved at $F_{30\%SPR}$ and ABC at the yield achieved at P* = 0.375*
  - *P* to remain unchanged from 0.375, but recommend Council select ACL or ACT to account for additional uncertainty that is described above (90% or 75% of $F_{30\%SPR}$)*

Table 1. Joint SSC catch level recommendations for Southeastern Yellowtail Snapper. Projected landings in millions of pounds under $F_{30\%SPR}$ (MFMT/OFL), the fishing mortality rate that corresponds to a P* value of 0.375 (ABC), 90% of $F_{30\%SPR}$, and 75% of $F_{30\%SPR}$ from 2021 – 2031.

Year	$F_{30\%SPR}$ (OFL)	P* = 0.375 (ABC)	90% of $F_{30\%SPR}$	75% of $F_{30\%SPR}$
2023	3.922	3.887	3.733	3.432
2024	3.774	3.749	3.635	3.401
2025	3.684	3.665	3.576	3.385
2026	3.625	3.610	3.537	3.375
2027	3.584	3.572	3.510	3.367

4. OTHER JOINT COMMITTEE BUSINESS

- Update on the Joint South Atlantic and Gulf of Mexico SSC Workgroup for Unassessed Stocks
  - *SA SSC members appointed to workgroup: Kai Lorenzen (chair), Wally Bubley, Amy Schueller, Genny Nesslage, and Anne Lange*
  - *GOM SSC members appointed to workgroup: Trevor Moncrief, Jason Adriance, Luiz Barbieri, Roy Crabtree, and David Griffith*
  - *Will convene a short webinar meeting this fall to discuss TORs, schedule, etc.*
  - *Original workgroup scope of work and objectives to be reviewed and considered by Joint workgroup members before meeting*
  - *Work may focus initially on addressing Goliath grouper stock ABC as requested by SA and GOM Councils.*

5. JOINT CONSENSUS STATEMENT AND RECOMMENDATIONS

The Committee is provided an opportunity to review its report, final consensus statements, and final recommendations.

JOINT MEETING ADJOURNED AT 12:05 P.M. EDT

--- LUNCH BREAK ---

(Following agenda items addressed by South Atlantic SSC only)

7. SEDAR 78: SOUTH ATLANTIC SPANISH MACKEREL OPERATIONAL ASSESSMENT

7.1 Documents

Attachment 7a: Stock Assessment Report for Spanish Mackerel
Attachment 7b: Presentation for Spanish Mackerel
Attachment 7c: Terms of Reference for Spanish Mackerel
Attachment 7d: S78 WP03, General Recreational Catch
Attachment 7e: South Atlantic ABC Control Rule

7.2 Presentation

Dr. Erik Williams, Southeast Fishery Science Center (Beaufort)

7.3 Overview

Spanish Mackerel was last assessed during the 2012 SEDAR 28 Benchmark, which indicated the stock was not overfished and not undergoing overfishing. For this SEDAR 78 assessment, data compilation and assessment methods were guided by methodology of SEDAR 28, as well as by current SEDAR practices and recommendations by the SEDAR 28 review panel. The assessment period is 1986–2020. The base-run estimate of terminal (2020) spawning stock was above the MSST (SSB_{2020}/MSST = 1.40), as was the median estimate from the MCBE (SSB_{2020}/MSST = 1.42), indicating this stock is not overfished. The estimated fishing rate has been at or below the maximum fishing mortality threshold (MFMT), represented by F_{MSY} with the exception of the terminal year (2020). The terminal estimate, which is based on a three-year geometric mean, was below F_{MSY} in the base run ($F_{2018–2020}$/ F_{MSY} = 0.77) and in the median of the MCBE ($F_{2018–2020}$/ F_{MSY} = 0.74). Thus, this assessment indicated that the stock is not experiencing overfishing. However, this result requires caution: if the overfishing rate of 2020 continued in 2021, the geometric mean would indicate overfishing. The SSC is asked to review the SEDAR 78: South Atlantic Spanish Mackerel Operational Assessment, comment and discuss projections and uncertainties, apply the South Atlantic Council's ABC Control Rule, and make catch level recommendations.

SSC General Comments:

- *Age comps and state/federal harvest breakdown is not accounted for in the assessment for all sectors (e.g. lack of age comps for commercial cast net). Substantial regional differences in how fishery is prosecuted, and lack of adequate sample sizes across sector type create large data gaps in the assessment and the need to pool age comps across years.*
- *10 years since last assessment → Given the time since the last assessment, further flexibility should have been provided for the operational assessment to make updates. Given this, a research track should be considered for next assessment.*

- *Several data (e.g. MRIP data) and model inputs (e.g. natural mortality, steepness, selectivity) that need to be explored more thoroughly (see below) and not under OA framework.*

7.4 Public Comment

- *See meeting transcript for public comment*
  1. *Ben Hartig*
  2. *Thomas Newman*
  3. *Dewey Hemilright*

7.5 Breakout Groups

- *Breakout group discussions recorded separately*
- *Breakout Group 1*
  - *SSC members: Chris Dumas (Rapporteur), Fred Scharf, Fred Serchuk, Jared Flowers, Jeff Buckel, Kai Lorenzen*
  - *Other: Julie Neer*
- *Breakout Group 2*
  - *SSC members: Dustin Addis (Rapporteur), Jie Cao, Marcel Reichert, Amy Schueller, Jennifer Sweeney-Tookes, Anne Lange*
  - *Other: Chip Collier*
- *Breakout Group 3*
  - *SSC members: Genny Nesslage (Rapporteur), Eric Johnson, George Sedberry, Scott Crosson, Wally Bubley, Yan Li*
  - *Other: Mike Schmidtke, Carolyn Belcher, Christina Wiegand, Emilie Franke, Jacob Espittia, Jeff Renchen*

7.6 Action

➢ **Review Assessment:**

- Does the assessment address the ToRs to the SSCs satisfaction?
  - Growth models shifted by one year between SEDAR 28 and SEDAR 78. Explain the cause of the shift and discuss the implications (status, productivity).
    The SSC doesn't know why the growth model was shifted by one year, nor the effect on the status and productivity of stock.
  - Steepness was fixed at 0.75 (same as in SEDAR 28). Is this appropriate for Spanish mackerel? Describe the impact of fixed steepness in general, and this fixed value in particular on Spanish Mackerel productivity estimates, reference points, and recruitment estimation in projections.
    The stock-recruitment (SR) data did not allow for an updated estimate of steepness in SEDAR 78; there was a cluster of points in the NE quadrant of the SR graph providing no information for a steepness estimate (no points were located in the SW area of the

graph). Steepness estimates from similar species do not appear to be available. The steepness value used in the SEDAR 78 (same as SEDAR 28) has high uncertainty as indicated by likelihood profiles.

- Assess uncertainties within the recreational data sources:
  - Are PSEs for the recreational catch estimates acceptable? *Not addressed*
  - Does the model fully incorporate the reported recreational catch estimation uncertainty? *Not addressed*
  - What is the impact of recreational catch uncertainty on stock status and productivity estimates? *Not addressed*
  - Recreational catch data from 2020 appears highly influential to model results. Does the 2020 data suggest a shift in fishing pressure or patterns, or is it an artifact of estimation uncertainty? Discuss the implications, to status and projected yield, of the sudden increase in recreational catch in the terminal year.
    Given that a 3-year average of fishing mortality was used, the 2020 estimate of catch is not currently influential; however, given that the 2021 estimate is similar or larger, the 3-year average may begin to affect stock status in the next few years. In contrast, the 2020 estimate does, already, affect projections. During the pandemic, total fishing effort was increased, which indicates that the increases seen for Spanish mackerel are not unexpected.

  - Describe the impact of the revised MRIP estimates on stock productivity measures.
    The revised MRIP estimates increase uncertainty. The model's estimates of stock size are going down in recent years while the observed landings are increasing. The increased landings could be driving the population down but there is uncertainty if this is the case given information provided during public input that suggests the potential for an increased stock size that could promote greater landings with no change in effort (e.g. questions about the accuracy of recent MRIP data, commercial quotas being met earlier in year during recent years). Shore-mode landings (these were higher than private boat mode which doesn't match on the water observations) appear to be important and driving changes in increased recreational landings.

- Are there any issues with the assessment configuration or uncertainties in the input data that limit the use of this assessment for providing stock status and supporting fishing level recommendations?
  - Discuss the predictive ability of the stock-recruit relationship for estimating MSY and F_{msy} and supporting stock projections.
    - *Parameters describing the SR curve were not updated from the 2012 assessment. The analysts were constrained in exploring this in more detail because SEDAR 78 was an OA.*
    - *The SR data do not show a clear pattern (a cluster of points in the NE quadrant of graph) and estimates of steepness from these data were unreliable. Steepness estimates from similar species are not available.*
- Does the assessment represent Best Scientific Information Available?
  - *The constraints of the OA and the poor quality/lack of data were a concern. Data/assessment concerns include:*
    - *The declining trend in biomass estimated by the OA was not reflective of what stakeholders described or observed in fishery-independent data sampling further north (NEAMAP).*
    - *Not clear that the current sampling program represents the current geographic distribution of the fishery (increased occurrences to the north suggests that the stock boundaries may have shifted).*
    - *There were questions regarding the recreational landings in recent years, especially shore-based mode (What is driving the increase in shore landings in recent years? Is it real?).*
    - *There have been large changes in the fishery (e.g. commercial cast-net landings have increased in importance), but large portions of the OA are based on the 2012 SEDAR 28 Benchmark that is now over a decade old.*
    - *The steepness estimate for the stock-recruitment curve was based on the 2012 assessment; this constrained the analysts.*
    - *The OA imposed constraints on the analysts. The SSC recommends a research track assessment be considered for the next assessment.*
    - *SEDAR 78 was sensitive to the same parameters (e.g., natural mortality--affected by changes made to growth model, negative t0, but little data to inform estimates of v-Bert curve; steepness) as those found for SEDAR 28.*

Changes in these parameters can change stock status as indicated by sensitivity analyses.

- *Jumps in recreational landings may reflect increases in recreational effort, increases in stock size or a combination of both.*
- *Over the last several years, commercial fisheries have been meeting quotas earlier in the year: is this because of increased effort or increased stock size?*
- *Because the evidence for a change in stock status is not strong, there is a concern that projections are not sufficiently robust. Projections (unlike current stock status) are influenced greatly by terminal year (2020), and terminal year is highly uncertain.*
- *The assessment model is estimating a decrease in spawning stock size as a result of the increases in catch and this is driving need for future catch reductions in the projections; however, other sources of evidence suggests that the stock size could be increasing.*

➢ **Identify, summarize, and discuss assessment uncertainties**

- Review, summarize, and discuss the factors of this assessment that affect the reliability of estimates of stock status and fishing level recommendations.
  - Characterize these factors in terms of their influence on assessment uncertainty and fishing level recommendations.
    - *As is common in many assessments, steepness and natural mortality are uncertain:*
      - *Steepness not estimable, and was fixed from previous assessment – SEDAR 28. There was no signal from data to inform steepness. This would apply to the ABC control Tier I.*
      - *Natural mortality was fixed from previous assessment – SEDAR 28. Natural mortality was found to have a significant impact on stock status. Likelihood profiles showed that natural mortality could be much higher (>0.5), which, if true, would indicate stock size is higher than currently estimated.*
    - *Lack of adequate representation of length and age samples from each fishery (most fleets) to inform fishing mortality.*
    - *Uncertainty of the Shrimp bycatch estimates was high (pdf pg 73). The observer coverage is extremely sparse and effort data are questionable.*

- *Lack of a pelagic fishery independent index of adult abundance*
- *Commercial Handline index fits were poor (severe underfitting/overfitting)*
- *Model ignored initial year of MRIP CPUE index (which was a relatively extreme value)*

- Address potential impacts of COVID events on input data series. For example:
  - How might the missing 2020 SEAMAP survey value affect abundance or mortality estimates?
    - *The influence of the lack of SEAMAP 2020 will be difficult to determine until additional years of data are collected.*
  - How did the interruptions in MRIP sampling impact 2020 estimates and their uncertainty?
    - *Somewhat addressed due to imputations used by MRIP to account for reduced sampling in 2020. The influence of the lack of SEAMAP 2020 data and the value of 2020 MRIP data will be difficult to determine until additional years of data are collected. We must evaluate the congruencies or incongruencies of these data to previous or future years' data.*
- List the risks and describe potential consequences of assessment uncertainties with regard to status, fishing level recommendations, and future yield predictions.
  - *When stock biomass is decreasing and fishing mortality is increasing in the terminal year, increased uncertainty can lead to overfished or overfishing stock status.*
- Are methods of addressing uncertainty consistent with SSC expectations and the available information?
  - *The methods of addressing uncertainty are consistent with SSC expectations and the available information. Dimension II – (2) Environmental variables are not considered.*

➢ **Review the assessment projections and provide fishing level recommendations**

- Apply the ABC control rule and complete the fishing level recommendations table.
  Pending SSC decision to accept the assessment for mgmt.:

  - ***ABC-CR Dimension Tiers for SEDAR78:***
    - *I. Assessment Information → Tier 2 (2.5%)*
    - *II. Uncertainty Characterization → Tier 2 (2.5%)*
    - *III. Stock Status → Tier 1 (0%)*

    - *IV. Productivity and Susceptibility (PSA) – Risk Analysis → Tier 2 (5%)*
- *Total ABC adjustment = 10.0%*
- *P-star value = 40.0%*

- Review the projection methods and the assumptions applied for the interim period (between the terminal year and the first year of management)
    - Do the projections and interim assumptions adequately capture uncertainty in the model and data? Uncertainty in recruitment?
        - *No, the SSC has several concerns with the assessment, including:*
            - *Commercial age sampling possibly inadequate*
            - *MRIP – high PSEs, uncertainty in terminal year data point*
            - *Influence of bad fit to initial year REC index (high value GR) on SSB*
            - *Uncertainty in steepness*
            - *Model likelihood profiling points to potentially higher natural mortality*
            - *YOY index missing terminal year data*
            - *Effect of removing early years with higher landings*

- Concerns have been expressed about the declining stock abundance and yield in the projection years, particularly since catch has been held below the current ABC and ACL and overfishing has not occurred.
    - Are the projected F rates in 2021-2022 reflective of the fishery?
        - *Given the concern with this OA, more attention should be paid to 2021-2022 MRIP estimates used in projections given the large sudden change in magnitude. Major source of uncertainty in setting catch levels. Would indicate a large increase in shore-based effort, which may or may not be realistic. With COVID, perhaps more shore-based angler effort, but in 2022 inflation may have decreased angler effort – TBD. More investigation is needed.*
    - How do the projected catch levels compare to catch levels observed in recent years in the model?
        - *Higher than 2020*
    - Comment on the implications of the expected spawning stock biomass in the projections falling outside the range of observed values.

- *If model is overestimating F in last few years, SSB decline is overestimated. However, if the Fs are truly that high, this response is to be expected.*

- Comment on any difficulties encountered in applying the Control Rule, including any required information that is not available.
  - *No difficulties were encountered.*

- **Provide guidance for information to include in the Coastal Migratory Pelagic (CMP) SAFE report.**
  - OFL/ACL monitoring: Discuss any potential issues in monitoring the commercial and recreational Spanish mackerel fishery.
    - *Potential movement of the stock northward in terms of ACL monitoring*
  - Catch level reports: What threshold of change in landings/discards should be used for the SSC to receive additional analyses to describe the estimate?
    - *Not addressed*
  - Population trends: Discuss which index of abundance is most suitable for monitoring the stock for inclusion in future SAFE report.
    - *Not addressed*
- **Provide research recommendations and guidance on the next assessment:**
  - Review the included research recommendations and indicate those most likely to reduce risk and uncertainty in the next assessment.
    - *The research recommendations that will most likely reduce risk and uncertainty in the next assessment include those that address the issues with SEDAR 78 described above (e.g. steepness, natural mortality, age comps).*
  - Provide any additional research recommendations the SSC believes will improve future stock assessments.
    - *Based on public comments from commercial fishermen, the stock may be moving northward, so research on stock distribution is warranted*
    - *Recreational discards – better characterization of age/size composition and mortality of discarded fish*

  - Provide guidance on the next assessment, addressing its timing, need for topical working groups, and assessment type.
    - Reminder: More than 2-3 topical working groups indicates that the assessment should be considered for a research track.
    - *Not addressed specifically in terms of working groups, but the SSC recommends a research track consideration.*

- Provide comments for the development of the scope of work for the next assessment (if operational assessment recommended)
  - *See comments above. An operational assessment is not recommended for the next assessment.*

CONSENSUS STATEMENT:

- *The SSC has several concerns with this OA before deeming consistent with BSIA:*
  - *The assessment model is appropriate, but inputs need to be more thoroughly investigated.*
  - *There are several concerns with certain aspects of the data quality that should be more thoroughly investigated before setting catch level recommendations*
  - *The operational assessment TORs constrained the modeling approach and there could be alternative data inputs that would benefit future assessments (something for future deliberation by the SSC)*
  - *Stock status classification has great deal of uncertainty because of terminal year data; this uncertainty leads into little confidence in projections.*
  - *Specific investigations into certain data inputs or model components (see lists above) should occur before management advice can be provided:*
    - *Technical group/subset of SSC members to compile specific list of recommendations to the SEFSC to improve upon assessment in order to achieve stock status determination and catch level recommendations.*
      - *Dustin Addis*
      - *Marcel Reichert*
      - *Yan Li (joined after the meeting)*

9. PUBLIC COMMENT

The public is provided one final opportunity to comment on SSC recommendations and agenda items.

See meeting transcript for public comment:

1. *Dewey Hemilright*
2. *Ben Hartig*

10. CONSENSES STATEMENT AND RECOMMENDATIONS

The Committee is provided an opportunity to review its report, final consensus statements, and final recommendations.

The Final SSC report will be provided to the Council by 9:00 a.m. on Friday, August 26, 2022 (approximately 3 weeks from the end of the meeting) for inclusion in the briefing book for the September Council meeting.

11. NEXT MEETINGS

11.1 Scientific and Statistical Committee Meetings

- October 25-27, 2022 in Charleston, SC
- February (TBD webinar as needed)
- April 18-20, 2023 in Charleston, SC
- October 24-26, 2023 in Charleston, SC

11.2 South Atlantic Fishery Management Council Meetings

- September 12-16, 2022 in Charleston, SC
- December 5-9, 2022 in Wrightsville Beach, NC
- March 6-10, 2023 in Jekyll Island, GA
- June 12-16, 2023 in PonteVedra, FL

ADJOURNED AT 6:21 p.m.

FINAL
SUMMARY REPORT
MACKEREL COBIA COMMITTEE
SOUTH ATLANTIC FISHERY MANAGEMENT COUNCIL
Charleston, South Carolina
September 15, 2022

The Committee approved minutes from the March 2022 meeting and the agenda.

Update on amendments recently submitted to NMFS
At the December 2021 meeting, the Council approved CMP Amendment 32 (Gulf cobia catch levels and management measures) for formal review. The Gulf Council approved CMP Amendment 32 for final action at their October 2021 meeting. The document was transmitted to NMFS on February 18, 2022, and the proposed rule published on July 7, 2022. At the March 2022 meeting the Council approved CMP Amendment 34 (Atlantic king mackerel catch levels and management measures) for formal review. The document was transmitted to NMFS on August 5, 2022.

CMP Amendment 33 – Updates to Gulf king mackerel management based on SEDAR 38 Update 2020
Matt Freeman, Gulf Council staff, presented draft options to be considered in Amendment 33, which proposes modifications to catch limits and sector allocations for Gulf king mackerel based on the results of the SEDAR 38 Update stock assessment. The stock assessment found that Gulf king mackerel was not overfished or undergoing overfishing. However, recruitment has been low over the last 10 years, and the spawning stock biomass (SSB) is below the SSB at maximum sustainable yield. The Committee reviewed the CMP FMP goals and objectives, the proposed action and alternatives, and actions taken by the Gulf Council during their June 2022 meeting.

The following motions were approved:

MOTION 1: ADD THE FOLLOWING LANGUAGE TO THE JOINT CMP FMP OBJECTIVES: TO ACHIEVE ROBUST FISHERY REPORTING AND DATA COLLECTION SYSTEMS ACROSS ALL SECTORS FOR MONITORING THE COASTAL MIGRATORY PELAGIC FISHERY WHICH MINIMIZES SCIENTIFIC, MANAGEMENT, AND RISK UNCERTAINTY.
APPROVED BY COMMITTEE
APPROVED BY COUNCIL

MOTION 2: REMOVE CURRENT OBJECTIVE 3 FROM THE CMP FMP OBJECTIVES.

> Objective 3: To provide necessary information for effective management and establish a mandatory reporting system for monitoring catch.

APPROVED BY COMMITTEE
APPROVED BY COUNCIL

MOTION 3: AMEND THE LANGUAGE OF OBJECTIVE 1 TO READ AS FOLLOWS: Objective 1 reads as follows: The primary objective of this FMP is to ACHIEVE AND MAINTAIN OPTIMUM yield ~~at the maximum sustainable yield (MSY),~~ TO allow recovery of overfished populations, and maintain population levels sufficient to ensure adequate recruitment.
APPROVED BY COMMITTEE
APPROVED BY COUNCIL

Atlantic Spanish Mackerel Management Overview
Staff presented an overview of management concerns that have arisen in the Spanish mackerel fishery since 2018 to provide context for the Council when discussing the SEDAR 78: Atlantic Spanish mackerel stock assessment.

SEDAR 78: Atlantic Spanish Mackerel Assessment
SEDAR 78 was completed in July 2022 and included an assessment for Atlantic Spanish mackerel. In August 2022, the Scientific and Statistical Committee (SSC) reviewed the results of the updated SEDAR 78 and recommended additional work completed. Shannon Cass-Calay presented the Southeast Fisheries Science Center (SEFSC) report and SSC Chair, Jeff Buckel, presented the SSC recommendations to the Committee. Council staff presented an overview of the Atlantic Spanish mackerel fishery.

The SEFSC will rerun the SEDAR 78 assessment model with new landings to address uncertainty with MRIP estimate in the terminal year. The SSC will review the changes at their upcoming October 2022 meeting and determine whether the changes were sufficient to address their cited concerns or if additional changes are needed. If additional changes are substantial, a research track assessment would be needed for Atlantic Spanish mackerel.

Given continuing closures in the commercial sectors, does the Council wish to apply the allocation decision tool to Spanish mackerel at the December 2022 meeting?
DIRECTION TO STAFF: PROCEED WITH APPLICATION OF ALLOCATION DECISION TOOL TO THE SPANISH MACKEREL FISHERY FOR BOTH SECTOR AND REGIONAL ALLOCATION TO BE DISCUSSED IN DECEMBER 2022

Topics for the Mackerel Cobia Advisory Panel
The Mackerel Cobia Advisory Panel is scheduled to convene on October 5th and 6th, 2022 in Charleston, South Carolina. Below is a list of approved topics for the AP's agenda:

- Update on amendments recently submitted.
- SEDAR 78: Atlantic Spanish Mackerel Stock Assessment
    - Update on stock assessment revisions.
    - Discussion of increased recreational shore-based landings and overall increase in recreational effort during the COVID19 pandemic.
    - Discussion of commercial trips limits and how the lower trip limit (500-pounds) has affected market price for Spanish mackerel.
- Discussion of the current false albacore (little tunny) fishery.
    - Have there been substantial changes in fishing behavior and catch levels for false albacore over the last five years?

    - How have social and economic influences (ex. price and demand, infrastructure, community dependance) affected the false albacore fishery?
    - What factors should the Council consider when determining whether or not false albacore are in need of conservation and management?
    - What else is important for the Council to know about false albacore?
- Review of CMP FMP Goals and Objectives
- Discussion of CMP Amendment 33 and how increased Gulf king mackerel commercial allocation may impact market price of Atlantic king mackerel.
- Commercial electronic logbook
- NOAA North Atlantic Right Whales Proposed Vessel Speed Regulations
- Hudson Canyon National Marine Sanctuary Proposal
- Update Fishery Performance Reports for Atlantic king mackerel and FLEC cobia.
- Other Updates: Citizen Science, SEDAR, Climate Change Scenario Planning

Other Business
On September 19, 2022, the Council received a letter from the American Saltwater Guides Association requesting the consider re-adding false albacore to the CMP FMP. The Committee provided the following direction to staff:

- DEVELOP A WHITE PAPER EXAMINING IF FALSE ALBACORE MEET THE MSA CRITERIA FOR CONSERVATION AND MANAGEMENT AND DISCUSS WITH THE AP.
    - WORK WITH NC DMF STAFF
    - LOOK AT STATE VS. FEDERAL LANDINGS

Note: Council staff drafts the timing and task motion based on Committee action. If points require clarification, they will be added to the draft motion. The Committee should review this wording carefully to be sure it accurately reflects their intent prior to making the motion.

Timing and Task(s)

MOTION 4: ADOPT THE FOLLOWING TIMING AND TASKS:

1. Work with Gulf Council staff, as needed, to continue work on Coastal Migratory Pelagics Amendment 33.
2. Add a review of the revised SEDAR 78 stock assessment to the SSC's October 2022 meeting agenda.
3. Convene a meeting of the Mackerel Cobia Advisory Panel to discuss the agenda items as listed above in October 2022.
4. Develop a white paper that examines false albacore relative to the ten criteria outlined in the Magnuson-Stevens act to determine if they may be in need of conservation and management.
5. Prepare the allocation decision tool for Atlantic Spanish mackerel to be reviewed at the December 2022 meeting.

APPROVED BY COUNCIL

Atlantic States Marine Fisheries Commission

1050 N. Highland Street • Suite 200A-N • Arlington, VA 22201

MEMORANDUM

TO: **Coastal Pelagics Management Board**

FROM: **Emilie Franke, FMP Coordinator**

DATE: **October 20, 2022**

SUBJECT: **Differences Between the Interstate FMP and Federal FMP for Spanish Mackerel**

In February 2020, the former South Atlantic Management Board, which is now split into the Coastal Pelagics Management Board and Sciaenids Management Board, discussed differences between the Interstate Fishery Management Plan (FMP) for Spanish mackerel and the federal Coastal Migratory Pelagics FMP for Spanish mackerel. The last update to the Interstate FMP was the Omnibus Amendment for Spanish Mackerel, Spot, and Spotted Sea Trout (2011) and its Addendum I for Spanish Mackerel (2013).

Differences between the Interstate and Federal FMPs exist in terms of commercial management zones, commercial trip limits and closures, allowable gears, recreational season, and recreational accountability measures. Board action to consider addressing these differences was postponed until completion of the 2022 stock assessment. The differences between the Interstate and Federal FMPs are outlined below.

Definition of Commercial Management Zones

The Interstate FMP defines the Northern Zone as New York through Georgia, and the Southern Zone as the east coast of Florida. The Federal FMP defines the Northern Zone as New York through North Carolina, and the Southern Zone as South Carolina through Florida (through the Miami-Dade/Monroe County line). For the Interstate FMP, Rhode Island joined the interstate management unit in 2021.

Commercial Trip Limits and Closures

For their respective Northern Zones, both the Interstate and Federal FMPs set a 3,500-pound commercial trip limit. For the interstate Southern Zone, the trip limit starts at 3,500 pounds and is reduced throughout the season depending on the date and how much of the quota is met. For the federal Southern Zone, the trip limit also starts at 3,500 pounds and is reduced depending on how much of the quota is met.

In federal waters, each management zone closes when that federal zone's total quota is met. Under the Interstate FMP, states are not required to close state waters when federal waters close. In recent years, Maryland, Virginia, and North Carolina have implemented a reduced 500-pound trip limit in state waters when the Northern Zone federal waters closed.

The commercial trip limits and management zones are summarized in the following table.

Commercial Management Zones and Trip Limits	
Interstate FMP	**Federal FMP**
Northern Zone New York to Georgia (RI joined in 2021) – 3,500-pound trip limit – Not required to close when federal waters close. *Note: In recent years, Maryland, Virginia, and North Carolina have implemented a 500-lb trip limit in state waters when the Northern Zone federal waters closed.*	*Northern Zone* New York to North Carolina – 3,500-pound trip limit – Closed when Northern Zone total quota is met.
Southern Zone Florida (east coast) – 3,500-pound trip limit: 3/1-11/30; – 3,500 limit Mon-Fri & 1,500 limit Sat-Sun: 12/1 until 75% adjusted quota taken; – 1,500 limit until 100% adjusted quota taken; – 500 limit after 100% adj. quota taken; – Not required to close when federal waters close.	*Southern Zone* South Carolina to Florida (east coast) – 3,500-pound trip limit until 75% of the Southern Zone adjusted quota is met; – 1,500 limit until 100% of the Southern Zone adjusted quota is met; – 500 limit after 100% of the Southern Zone adjusted quota is met; – Closed when the Southern Zone total quota met.

Allowable Gears

The Interstate FMP lists prohibited gears for each sector. For the commercial sector, purse seines, and drift gill nets south of Cape Lookout, NC are prohibited. For the recreational sector, drift gill nets south of Cape Lookout, NC are prohibited. The Federal FMP lists allowable gears: only automatic reel, bandit gear, handline, rod and reel, cast net, run-around gillnet, and stab net allowed.

Recreational Season

The Interstate FMP specifies a calendar year recreational season, while the Federal FMP's recreational fishing year is March 1 through the end of February.

Recreational Accountability Measures

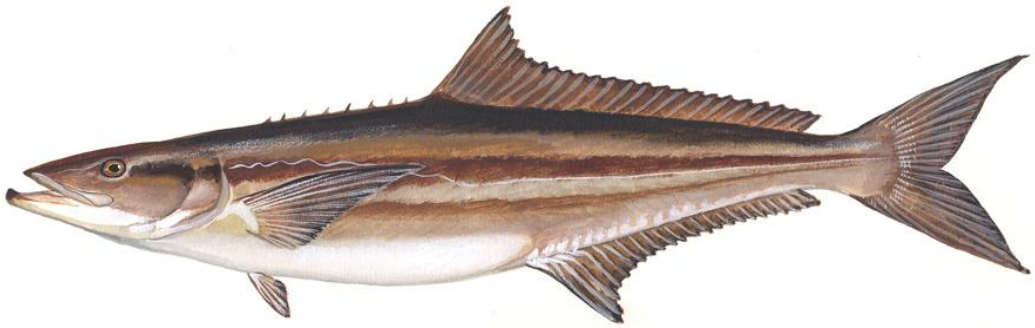
Under the Interstate FMP, if the total annual catch limit (ACL) is exceeded and the stock is overfished, the recreational quotas are decreased via reduced bag limits the following year. Under the Federal FMP, if the total ACL is exceeded, bag limits are reduced the following year to achieve the annual catch target (ACT) but not to exceed the ACL. If the stock is overfished and the ACL is exceeded, there is a payback reducing the ACT by the overage amount the following year.

ATLANTIC STATES MARINE FISHERIES COMMISSION

REVIEW OF THE INTERSTATE FISHERY MANAGEMENT PLAN

FOR ATLANTIC COBIA
(*Rachycentron canadum*)

2021 FISHING YEAR



Prepared by the Plan Review Team

Draft for Board Review
October 2022

Sustainable and Cooperative Management of Atlantic Coastal Fisheries

Table of Contents

I. Status of the Fishery Management Plan

Date of FMP Approval:	Original FMP – November 2017
Amendments & Addenda:	Amendment 1 – August 2019 Addendum 1 – October 2020
Management Areas:	The distribution of the Atlantic stock of cobia from Georgia through Rhode Island
Active Boards/Committees:	Coastal Pelagics Management Board; Cobia Technical Committee, Plan Development Team, and Plan Review Team; South Atlantic Species Advisory Panel

The Atlantic States Marine Fisheries Commission (ASMFC) adopted an Interstate Fishery Management Plan (FMP) for the Atlantic Migratory Group of cobia (Atlantic cobia) in 2017 (ASMFC, 2017). Prior to the FMP, federal management was through the South Atlantic Fishery Management Council's (SAFMC) Fishery Management Plan for Coastal Migratory Pelagic Resources (CMP FMP), while New York, New Jersey, Delaware, Virginia, North Carolina and South Carolina had regulations for their respective state waters.

The FMP established a complementary management approach between the ASMFC and SAFMC. Under the ASMFC, Atlantic cobia are managed as part of the Coastal Pelagics Board (Board). Through the FMP, regulations for states with a declared interest were required to reflect several measures established federally through the CMP FMP.

In March, 2019, Regulatory Amendment 31 to the CMP FMP became effective (SAFMC, 2018). This removed Atlantic cobia from the CMP FMP, resulting in management solely through the ASMFC.

In August, 2019, the Board approved Amendment 1 to reflect removal of Atlantic cobia from the CMP FMP, assume management responsibilities previously accomplished through the SAFMC and CMP FMP, and establish recommendations for measures in federal waters. Amendment 1 stated requirements were to be implemented by July, 2020.

Amendment 1 maintains many regulations of the original Commission FMP and previous CMP FMP. These include a 36-inch fork length (or 40-inch total length) recreational minimum size limit, 1 fish per person recreational bag limit, a recreational daily vessel limit not to exceed 6 fish per vessel, a 33-inch fork length (or 37-inch total length) commercial minimum size limit, and a commercial possession limit of 2 cobia per person not to exceed 6 cobia per vessel.

There are four plan objectives:

1) Provide a flexible management system to address future changes in resource abundance, scientific information, and fishing patterns among user groups or areas.

2) Promote cooperative collection of biological, economic, and social data required to effectively monitor and assess the status of the cobia resource and evaluate management efforts.
3) Manage the cobia fishery to protect both young individuals and established breeding stock.
4) Develop research priorities that will further refine the cobia management program to maximize the biological, social, and economic benefits derived from the cobia population.

In February, 2020, the Board approved an annual total harvest quota of 80,112 fish for 2020-2022, based on results from the Southeast Data, Assessment, and Review (SEDAR) 58 stock assessment for Atlantic cobia, allocated to the recreational and commercial sectors based on the Amendment 1 allocation of 92% recreational and 8% commercial. However, states with commercial harvest had an agreement to harvest a smaller portion of that amount in 2020. SEDAR 58 used updated recreational catch estimates from the Marine Recreational Information Program's (MRIP) 2018 transition and calibration to the mail-based Fishing Effort Survey effort estimates, which replaced those of the Coastal Household Telephone Survey.

Given the increased recreational catch estimates used in the SEDAR 58 assessment, the total annual quota approved by the Board also increased, resulting in increases to both the recreational and commercial quotas. As this increase in recreational harvest did not truly reflect a change in previous effort, only the estimate of that effort, Addendum I to Amendment 1 was approved by the Board in October 2020 to reconsider the percent allocations to the commercial and recreational sectors to better reflect the observed harvest. The Addendum changed the allocation of the resource between the recreational and commercial fisheries from 92% and 8%, respectively, to 96% and 4%, respectively. The calculation of the commercial trigger, which determines when an in season coastwide commercial closure occurs, was also revised. The Addendum established a commercial *de minimis* set aside of 4% of the commercial quota with a maximum cap of 5,000 pounds to account for potential landings in *de minimis* states not tracked in-season against the quota. The Addendum also allowed states that are *de minimis* for their recreational fisheries to choose to match the recreational management measures implemented by an adjacent non-de minimis state (or the nearest non-de minimis state if none are adjacent) or limit their recreational fishery to 1 fish per vessel per trip with a minimum size of 33 inches fork length (or an equivalent total length of 37 inches). Based on maturity data from the SEDAR 58 assessment, this latter regulatory option was updated from 29 inches fork length to 33 inches fork length in Addendum I to allow a greater number of females to spawn before being susceptible to harvest. Addendum I measures were effective January 1, 2021.

In May 2022, the Board changed the cobia quota timeframe from 2020-2022 to 2021-2023, thereby, maintaining the total harvest quota of 80,112 fish for the 2023 fishing season. Per the Addendum I allocation of 96% for the recreational sector, the coastwide recreational harvest target for 2021-2023 fishing seasons is 76,908 fish and results in the following state-specific soft targets:

Georgia - 7,229 fish
South Carolina - 9,306 fish
North Carolina - 29,302 fish
Virginia - 30,302 fish
De minimis - 769 fish

Per the Addendum I allocation of 4% to the commercial sector, the commercial fishery has a coastwide commercial quota of 73,116 pounds (3,204 fish) annually for the 2021-2023 fishing seasons. The current management measures for the commercial fishery include a 33" FL minimum size limit and 2 fish limit per person, with a 6 fish maximum vessel limit. The commercial Atlantic cobia fishery will close once the commercial quota is projected to be reached.

The Board will meet in 2023 to consider setting new specifications for the 2024-2026 fishing seasons.

II. Status of the Stock

SEDAR 58

In 2020, the Board approved the SEDAR 58 Atlantic Cobia benchmark assessment for management use which continued to use the Beaufort Assessment Model (BAM), a forward-projecting statistical catch-at-age model used in the prior assessment, SEDAR 28 (SEDAR 2013). SEDAR 58 provided new reference points and determined that the stock is not overfished and overfishing is not occurring (Figures 1 and 2). This assessment had a terminal year of 2017, and used the recalibrated recreational catch data from MRIP, which yielded much higher biomass and spawning stock biomass estimates as compared to SEDAR 28 (Figure 3). Even with the large changes in biomass estimates, the trends of abundance, recruitment, and relative status were very similar between the two assessments. Stock structure also remained unchanged from the SEDAR 28 assessment which established the stock boundary between Atlantic and Gulf of Mexico cobia at the FL/GA border with the Atlantic stock extending northward to Rhode Island.

Updated Reference Points

The assessment proposed updated reference points of $F_{40\%}$ and 75% of $SSB_{F40\%}$ as the threshold reference points (Figures 4 and 5). The reference points were selected as the fishing rate and SSB that allows the population to reach 40% of the maximum spawning potential the stock would have obtained in the absence of harvest. These reference points serve as proxies for maximum sustainable yield-derived relationships due to insufficient data for cobia.

Status of the Stock and Fishery

Spawning stock biomass showed little overall trend throughout the estimated time series, but the terminal year is the lowest in the time series. Age structure estimated by the base run indicated a slight decline in the number of younger fish in the last decade, but the rest of the age structure was above the expected values in 2017. The estimated fishing mortality rates have generally increased through the assessment time frame, peaking in 1996, with the recreational fleet as the largest contributor to total F ($F_{2015\text{-}2017}/F_{40\%} = 0.29$).

III. Status of the Fishery

Regulations, by state, for the 2021 fishing year are presented in Table 1. Total Atlantic cobia landings are estimated at about 2.7 million pounds in 2021, which is a 13% increase from 2020 (Figure 6, Tables 2 and 3). The commercial and recreational fisheries harvested 2.5% and 97.5% of the 2021 total, respectively.

Commercial landings of Atlantic cobia in 2021 span from Rhode Island through Georgia (Table 2). Coastwide commercial landings show an increasing trend since low harvests in the 1970s and early 1980s but comprise a small portion of the total harvest due, in part, to the current 4% allocation of the total annual harvest quota (Figure 6); the commercial allocation was 8% in 2019 and 2020. Coastwide cobia commercial landings in 2021 were estimated at 66,499 pounds. North Carolina (44%) and Virginia (44%) harvested the majority of the commercial landings (Table 2). The total non-*de minimis* commercial landings did not reach the commercial trigger level for fishery closure, so the commercial fishery in state waters remained open through the end of 2021.

Recreational harvests have fluctuated widely throughout the time series, often through rapid increases and declines. Average recreational harvest for the time series is 1 million pounds (Figure 6, Table 3) and about 38,000 fish (Figure 7, Table 4). This fishery has grown noticeably over the time series, with average harvests over the last 10 years of 2.1 million pounds and about 74,000 fish. The 2021 recreational harvest was 2.6 million pounds (90,807 fish). Virginia (66% of pounds, 63% of fish) and North Carolina (13% of pounds, 12% of fish) harvested the majority of recreational landings by pounds and number of fish. Average weight (recreational harvest in pounds divided by recreational harvest in numbers) in 2021 was 28.7 pounds per fish—a decrease by an average 1 pound per fish from 2020.

Per Addendum I, each state's recreational landings will be evaluated against state recreational harvest targets at the same time as the specification process, which will likely occur in 2023 when specifications are considered for 2024-2026.

Recreational releases of live fish have generally increased throughout the time series (Figure 7, Table 5). In 2021, 300,468 recreationally-caught fish were released, a 22% increase from 2020. Over the last five years 2017-2021, an average 79% of cobia caught recreationally were released alive each year. This is higher than the average 61% released alive during the previous five-year period of 2012-2016.

IV. Status of Assessment Advice

Current stock status information comes from SEDAR 58 (SEDAR, 2020), which determined the stock is not overfished and overfishing is not occurring. Results of this assessment were approved for management use by the Board at their February 2020 meeting, and, as such, have been incorporated into ASMFC's FMP.

The stock assessment could be improved by developing a fishery-independent sampling program for abundance of cobia and other coastal migratory pelagic species. The currently used fishery-dependent index causes notable uncertainty in part due to the lack of an effective sampling methodology. In addition, while the terminal year of the assessment was 2017, due to federal water closures, the index could only be calculated through 2015. The assessment could also benefit from improved characterization of age, reproductive, genetic, and migratory characteristics, tag-based information on natural mortality, and more precise recreational catch estimates.

The next SEDAR stock assessment for the Atlantic cobia stock would be an operational (i.e., update) assessment tentatively scheduled for 2025. The terminal year would likely be 2023 or 2024 and the assessment would likely be available to inform 2026 management.

V. Status of Research and Monitoring

There are no monitoring or research programs required annually of the states except for the submission of a compliance report. Fishery-dependent data collections (other than catch and effort data) are conducted in Maryland, Virginia, North Carolina, South Carolina, and Georgia. Data collected includes length, age, and sex data. Fishery-independent monitoring programs conducted by states that may encounter cobia are conducted in New Jersey, Delaware, Maryland, South Carolina, and Georgia.

VI. Status of Management Measures and Issues

Fishery Management Plan

Some states implemented new recreational cobia measures in 2021 based on Addendum I. As approved by the Board, Virginia and North Carolina changed their measures after evaluation of previous landings against their new Addendum I recreational harvest targets. Virginia's 2021 measures were designed to reduce recreational harvest by 42% by lowering the vessel limit from 3 fish to 2 fish, and shortening the season by 30 days (changed to June 15-September 15).

North Carolina liberalized their measures in 2021 based on their harvest target, and the vessel limit was increased for private anglers only to allow 2 cobia per vessel per day in June (previously only allowed in May).

Some *de minimis* states also adjusted their 2021 recreational measures based on the updated *de minimis* requirement in Addendum I. Maryland and the Potomac River Fisheries Commission (PRFC) adjusted their vessel limit and season to maintain consistency with Virginia's, the nearest non-*de minimis* state to them.

New Jersey, Delaware, and Rhode Island have implemented the standard *de minimis* measures (1 fish per vessel/minimum size of 37 inches total length/no seasonal restrictions) rather than using the nearest non-*de minimis* state regulations. Rhode Island's measures were effective January 1, 2022 after joining the Board and declaring an interest in the cobia fishery in 2021.

In 2020, the South Carolina legislature codified the federal regulations for Cobia into the South Carolina Code of Laws. Prior to this, Cobia regulations (outside of the SCMZ) were covered by legal adherence to federal regulations for any species that did not have specific regulations in South Carolina law.

De Minimis

For the recreational sector, the FMP requires adherence to state harvest targets, allocated to non-*de minimis* states from the total harvest quota allocated to the recreational sector. One percent of the quota is designated to account for harvest in *de minimis* states.

The FMP allows states to request recreational *de minimis* status if their recreational harvests (in pounds) in two of the previous three years are less than 1% of annual coastwide recreational landings during that time period. If a state qualifies for *de minimis*, the state may choose to match all FMP-related recreational management measures (including seasons and vessel limits) implemented by an adjacent non-*de minimis* state (or the nearest non-*de minimis* state if none are adjacent) or the state may choose to limit its recreational fishery to 1 fish per vessel per trip with a minimum size of 33 inches fork length (or 37 inches total length) with no seasonal restrictions. Rhode Island, New Jersey, Delaware, Maryland, and Florida requested recreational *de minimis* status through the annual reporting process. All of these states except Maryland meet the recreational *de minimis* qualifications.

Maryland in their compliance report acknowledged their recreational harvest was over the 1% recreational *de minimis* threshold in 2020 (1.7%) and 2021 (5.0%) after having zero landings in 2019. Given variability in landings year to year and that 2020 landings were close to the 1% threshold, Maryland requested to continue under recreational *de minimis* status for another year until 2022 recreational harvest can be evaluated.

De minimis status for commercial fisheries may be granted to states if their commercial landings for 2 of the previous 3 years were less than 2% of the coastwide commercial landings for the same time period. Commercial regulations in *de minimis* states are also limited to a minimum size of 33 inches FL with 2 fish per person for a total of 6 fish per vessel (the same requirements as non-*de minimis* states). Commercial *de minimis* states are not required to monitor their in-season harvests. Rhode Island, New Jersey, Delaware, Maryland, Georgia, and Florida requested *de minimis* status for commercial fisheries through the annual reporting process. All of these states except New Jersey meet the commercial *de minimis* qualifications.

New Jersey in their compliance report acknowledged their commercial harvest was over the 2% commercial *de minimis* threshold in 2019 (confidential) and 2021 (3.4%). New Jersey noted the landings in 2019 and 2021 are considered to be anomalously high compared to the past decade of landings which have previously qualified New Jersey for commercial *de minimis* status. New Jersey also noted their preliminary 2022 landings data are less than 20% of the landings during the same time in 2019 and 2021, and the 2% *de minimis* threshold is not anticipated to be exceeded in 2022. For these reasons, New Jersey requests to continue under commercial *de minimis* status for another year until 2022 commercial harvest can be evaluated. Additionally, New Jersey notes they will continue to work towards implementing mandatory in-season reporting of commercial cobia landings so that, should New Jersey's commercial cobia landings continue to consistently exceed the 2% threshold, the mechanism will be in place to maintain compliance with the FMP requirements.

VII. Implementation of FMP Compliance Requirements for 2021

The PRT finds no inconsistencies among states in regards to the Fishery Management Plan.

VIII. Recommendations of the Plan Review Team

Management

The PRT recommends that the Board approve the 2022 FMP Review, state compliance, and all *de minimis* requests from Rhode Island, New Jersey, Delaware, Maryland, Georgia, and Florida.

The PRT agrees with the rationale provided by Maryland for their recreational fishery and New Jersey for their commercial fishery to continue under *de minimis* status until 2022 harvest can be evaluated next year. The PRT supports New Jersey's efforts to work toward building the mechanism for in-season commercial cobia monitoring given the potential for future landings to increase beyond the *de minimis* threshold.

The PRT emphasizes that multiple states could exceed *de minimis* thresholds over the next few years if cobia landings continue to increase in Mid-Atlantic states due to cobia potentially becoming more available in those areas. The PRT notes the management implications of this, including requiring commercial in-season monitoring in more states and adding new states to the calculation of state-specific recreational harvest targets. The PRT also notes the current allocation of recreational quota to each state is based on landings data through only 2015, which may need to be updated to reflect more recent years.

As the Board considers potential management action with the next set of specifications and with the next stock assessment, the PRT recommends the Board discuss whether updates to the state-by-state recreational harvest allocations are warranted.

Finally, the PRT noted New York's recent cobia commercial landings, which were 6.9% of coastwide commercial landings in 2020 and 2.4% in 2021. Considering these landings, the PRT recommends New York declare an interest in Atlantic cobia and update their cobia regulations for 2023 to at least meet requirements for *de minimis*. The PRT notes that in-season monitoring of New York's cobia landings may need to be implemented in the following years.

Research

The following are important research recommendations from the PRT:

Continue to collect and analyze current life history data from fishery independent and dependent programs, including full size, age, maturity, histology workups and information on spawning season timing and duration. Increase spatial and temporal coverage of age samples collected regularly in fishery dependent and independent sources. Continue collection of genetic material to continue to assess the stock identification and any Distinct Population Segments that may exist within the management unit relative to recommendations made by the SEDAR 58 Stock ID Process.

Define, develop, and monitor adult and juvenile abundance estimates through the expansion of current or development of new fishery independent surveys.

Expand existing fishery independent surveys in time and space to better define and cover cobia habitats, including conducting otolith microchemistry studies to identify regional recruitment contributions and new and ongoing satellite tagging programs to help identify spawning and juvenile habitat use and regional recruitment sources. Additional work to better understand the impacts of climate change on cobia habitat and range expansion.

Additional research recommendations can be found in Section 2.8 of the SEDAR 58 stock assessment.
